Cancer Associated Transcription Factors

NAME	CANCER TYPE	NAME	CANCER TYPE
<i>ALSO31</i>	acute lymphoblastic leukemia	<i>NFKB1</i>	Acute lymphoblastic leukemia
<i>ASCL1</i>	small cell lung cancer (SCLC)	<i>NFKB2</i>	B-Cell lymphoma
<i>BCL3</i>	B-cell leukemia	<i>PAX3</i>	alveolar rhabdomyosarcoma
<i>BCL6</i>	B cell lymphoma	<i>PAX5</i>	B-Cell lymphoma
<i>CBFB</i>	myeloid leukemia	<i>PAX7</i>	alveolar rhabdomyosarcoma
<i>CBL</i>	pre-B and pro-B cell lymphomas	<i>PBX1</i>	leukemia
<i>CTNNB1</i>	Colon cancer	<i>RARA</i>	AML
<i>DEK</i>	Leukemia, acute nonlymphocytic	<i>REL</i>	Diffuse large cell lymphoma
<i>ERG</i>	Acute myeloid leukemia (AML)	<i>RELA</i>	Diffuse large cell lymphoma
<i>ETS1</i>	erythroblastosis	<i>RUNX1</i>	Leukemia, acute myeloid
<i>ETS2</i>	erythroblastosis	<i>SP11</i>	acute murine erythroleukemia
<i>ETV6</i>	AML	<i>STAT3</i>	Leukemia
<i>FOS</i>	murine osteosarcoma	<i>TALI/SCL</i>	T cell leukemia
<i>FKHR</i>	rhabdomyosarcoma	<i>TAL2</i>	T cell leukemia
<i>GAS41</i>	Glioma	<i>TCF3</i>	Acute leukemias
<i>GLI</i>	Glioma	<i>BLIMP1</i>	B-cell non-Hodgkin lymphoma
<i>HOX11</i>	Leukemia	<i>E2F1</i>	Murine Reproductive tract sarcomas
<i>IRF2</i>	AML	<i>IRF1</i>	AML
<i>IRF4</i>	multiple myeloma	<i>MAX11</i>	prostate adenocarcinoma
<i>JUN</i>	murine osteosarcoma	<i>PML</i>	Acute promyelocytic leukemia
<i>LMO2</i>	Acute T-cell leukemia	<i>RBI</i>	retinoblastoma
<i>LYL1</i>	T-cell leukemia	<i>SMAD3</i>	colorectal cancer
<i>MAF</i>	multiple myeloma	<i>SMAD4/DPC4</i>	pancreatic carcinoma; juvenile polyposis
<i>MLL</i>	AML	<i>TFE3</i>	renal cell carcinoma
<i>MYB</i>	Leukemia	<i>TFE3</i>	Colorectal cancer and other types
<i>C-MYC</i>	Lymphoma, Breast Cancer, lung cancer	<i>WT1</i>	Wilms tumor
<i>N-MYC</i>	neuroblastoma	<i>ZF9/KLF6</i>	prostate cancer

How to map transcription factor targets?

Rationale & Methodology

Genome wide location analysis

Mapping Transcription factor targets in human cells

Making Promoter Arrays

Dissecting the Myc/Max regulatory network

What are the target genes?

How is specificity determined?

Genome-wide Location Analysis

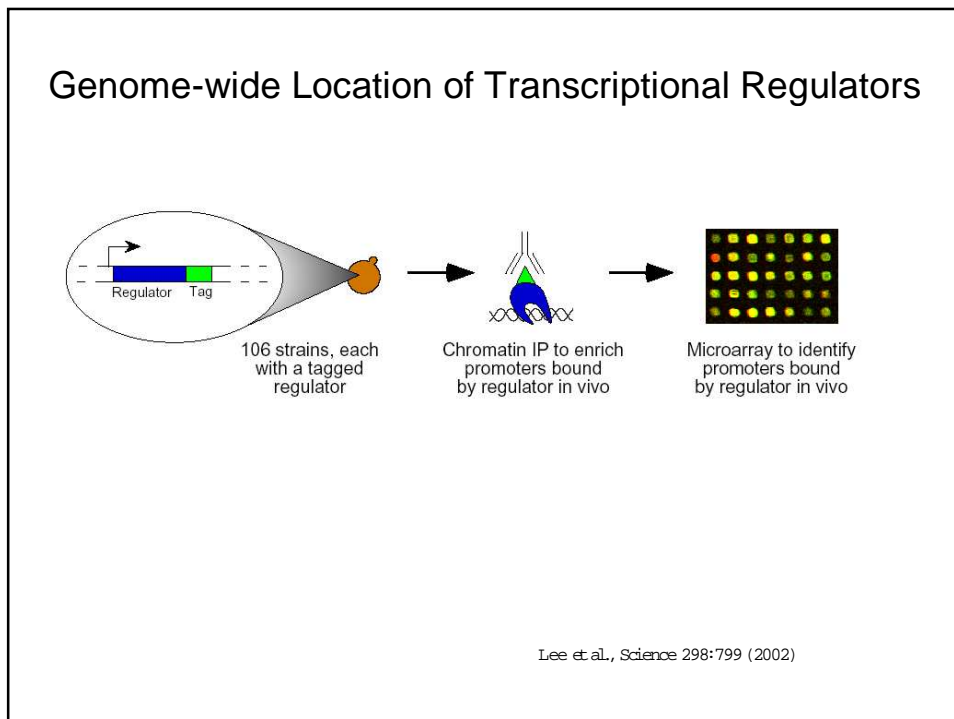

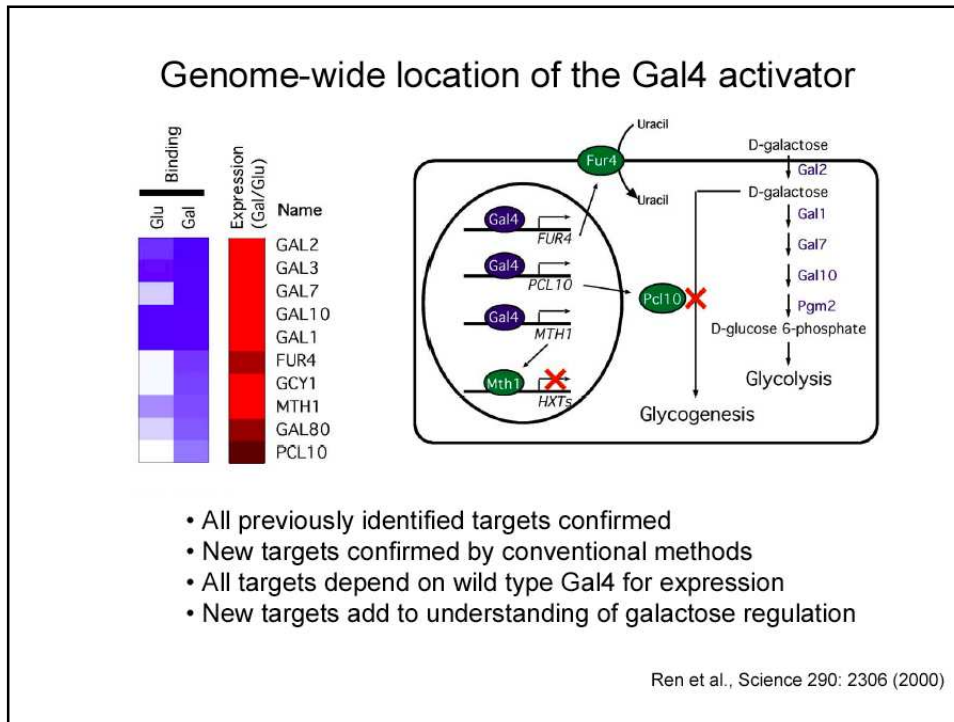

1. Cell cultures grown under appropriate conditions
2. Cross-link with formaldehyde
Shear chromatin by sonication
3. Immunoprecipitate with specific antibody
 - polyclonal or monoclonal
 - epitope-tag
4. Amplify/label DNA
 - label IP DNA with Cy5
 - label input DNA with Cy3
5. Hybridize to DNA microarray containing all ORFs and intergenic regions and scan

Dissecting the Myc Regulation Network Using Promoter Microarrays

Dissecting the Myc Regulation Network Using Promoter Microarrays

Genome-wide Location of Transcriptional Regulators

At $p=0.001$:
 False positive rate is 5-7%
 Regulators identified for 40% of yeast genes (2343)

Dissecting the Myc Regulation Network Using Promoter Microarrays

How to map transcription factor targets in mammalian cells?

Rationale & Methodology

Genome wide location analysis

Mapping Transcription factor targets in human cells

Making promoter microarrays

Dissecting the Myc/Max regulatory network

What are the target genes?

How is specificity determined?

Does genome location analysis work with human cells?
— Challenges

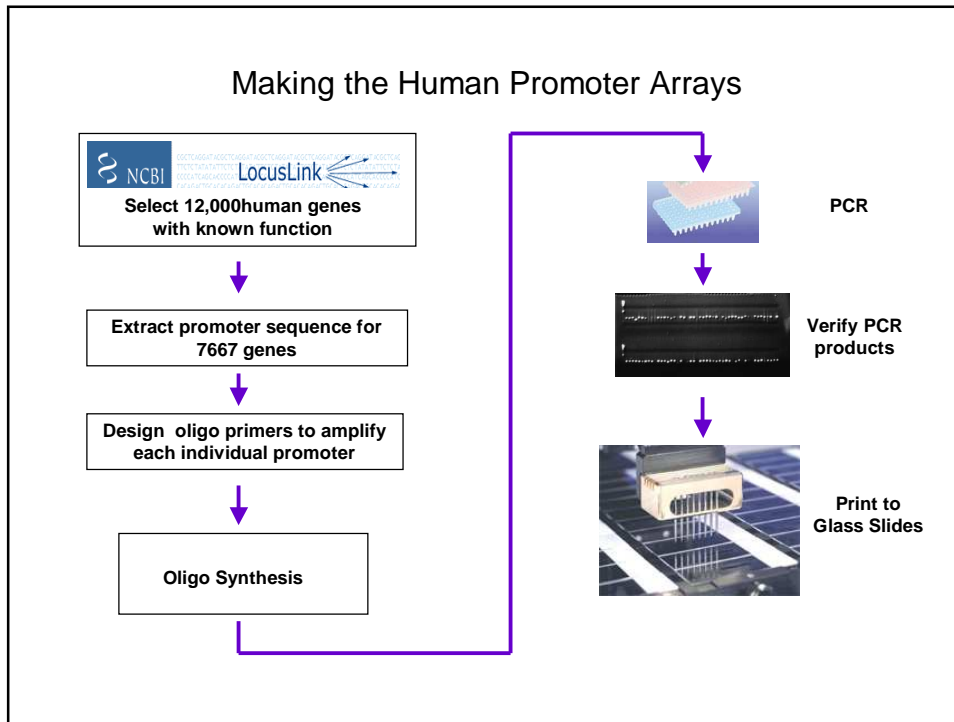

- Genome is 200 times bigger than yeast
- Abundant repetitive sequences
- Annotation of gene structure and function is much less complete
- Many different cell types
- Quality of antibodies

Translocation of c-myc in Human Cancers

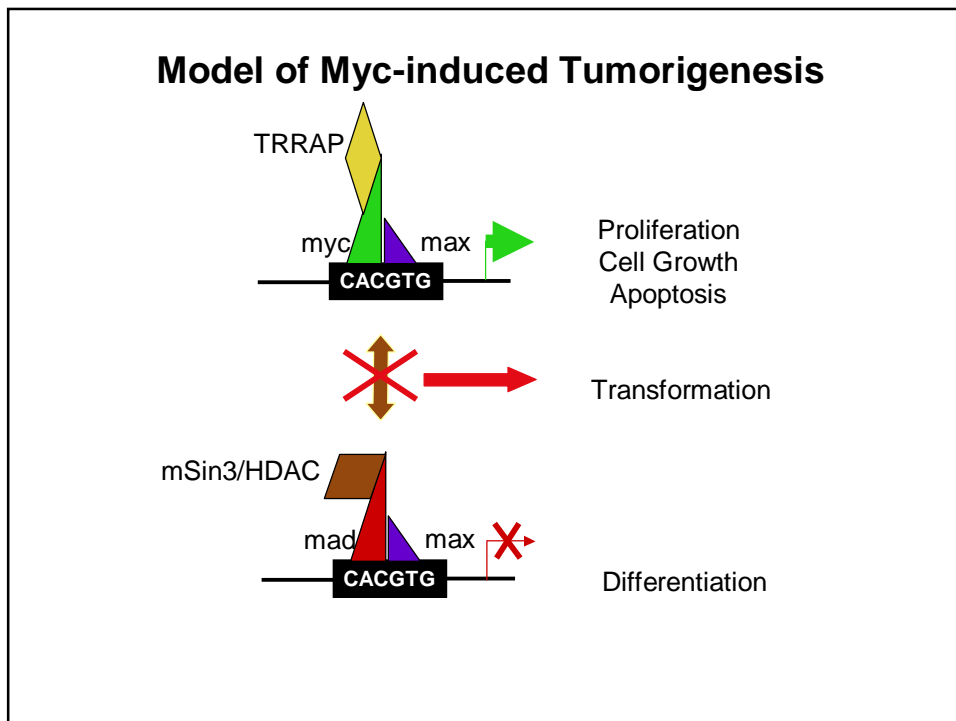

Translocation	Genes	Disease
t(8;14)(q24;q32)	<i>c-myc</i> /IgH	Burkitt's lymphoma
t(2;8)(p12;q24)	Igκ/ <i>c-myc</i>	Burkitt's lymphoma
t(8;22)(q24;q11)	<i>c-myc</i> /Igλ	Burkitt's lymphoma
t(8;14)(q24;q32)	<i>c-myc</i> /IgH	Diffuse large cell lymphoma
t(8;14)(q24;q11)	<i>c-myc</i> /TCRα,β	T-cell acute lymphoblastic leukemia
t(8;14)(q24;q32)	<i>c-myc</i> /IgH	Multiple myeloma
t(2;8)(p12;q24)	Igκ/ <i>c-myc</i>	Multiple myeloma
t(8;22)(q24;q11)	<i>c-myc</i> /Igλ	Multiple myeloma

Boxer and Dang, *Oncogene* (2001)

The Myc, Max and Mad Families

Dissecting the Myc Regulation Network Using Promoter Microarrays

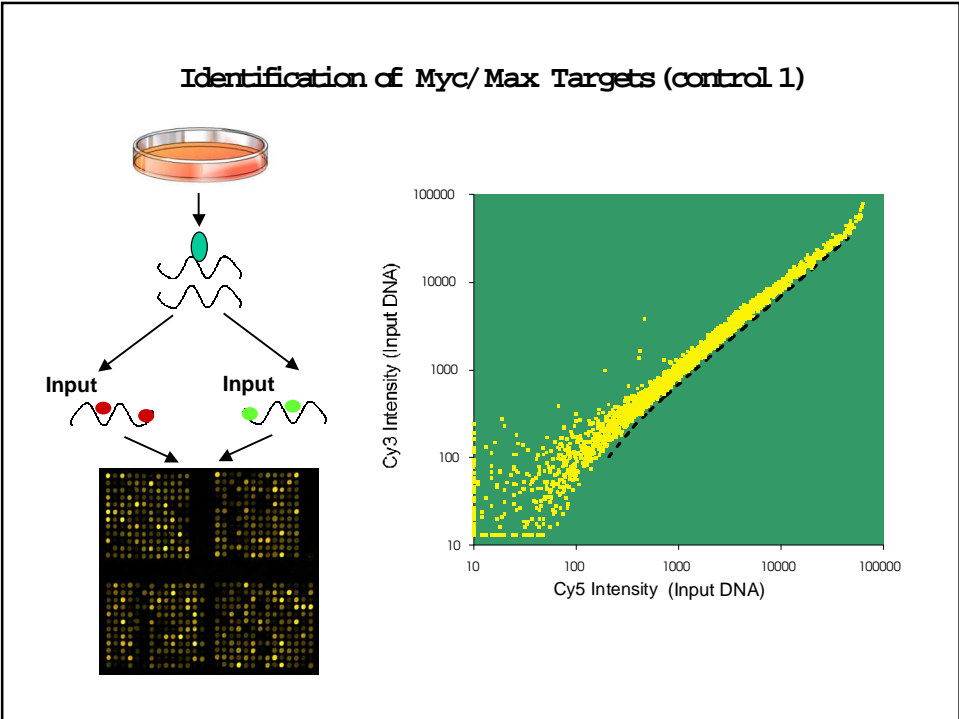

Dissecting the Myc Regulation Network Using Promoter Microarrays

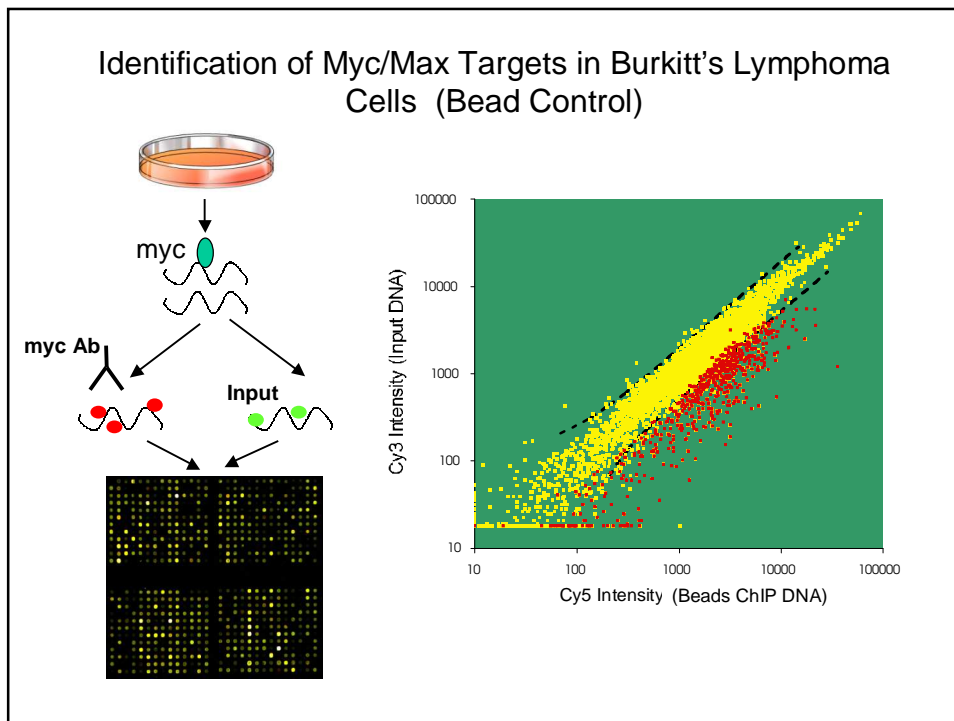

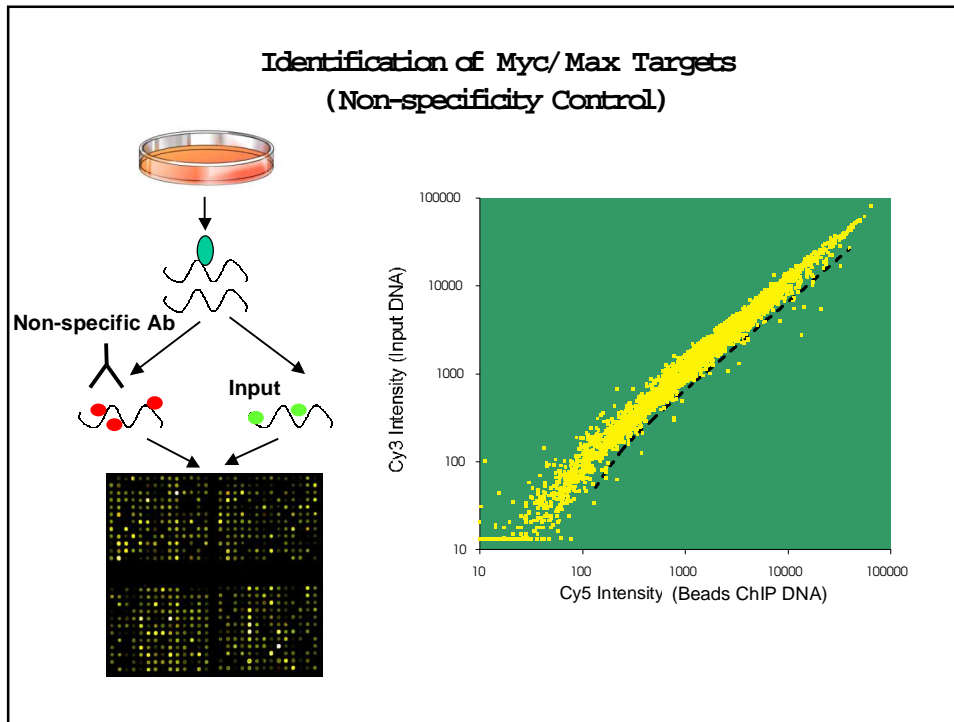

Questions Regarding the Myc Regulatory Network

- What are the target genes?
- How are the target sites recognized in vivo?
- What are the mechanisms of c-myc activation or repression?

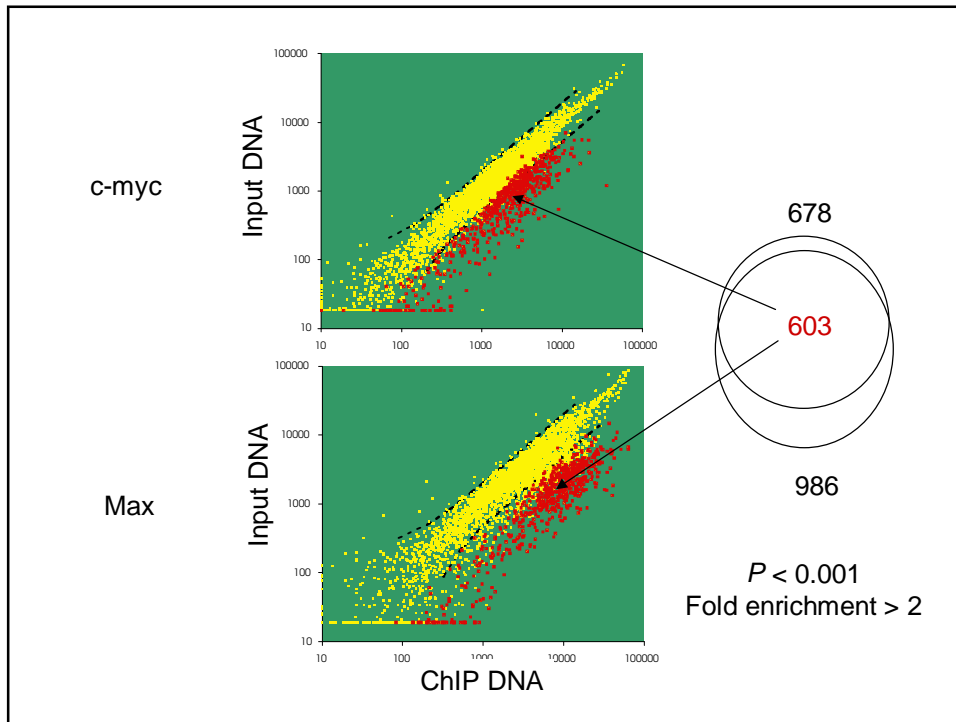

Dissecting the Myc Regulation Network Using Promoter Microarrays

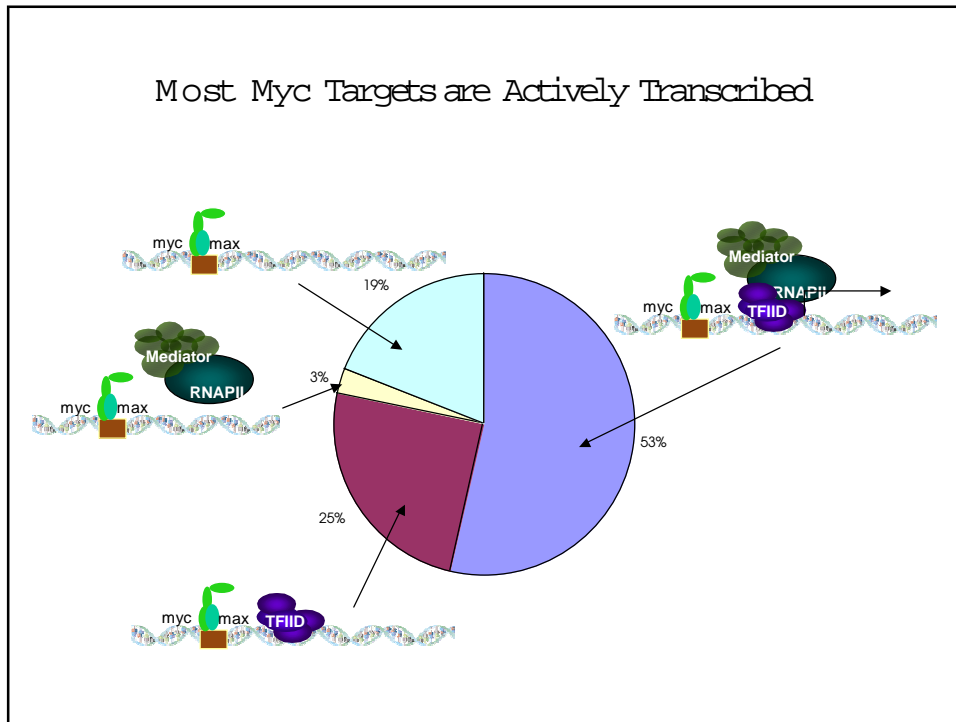

Dissecting the Myc Regulation Network Using Promoter Microarrays

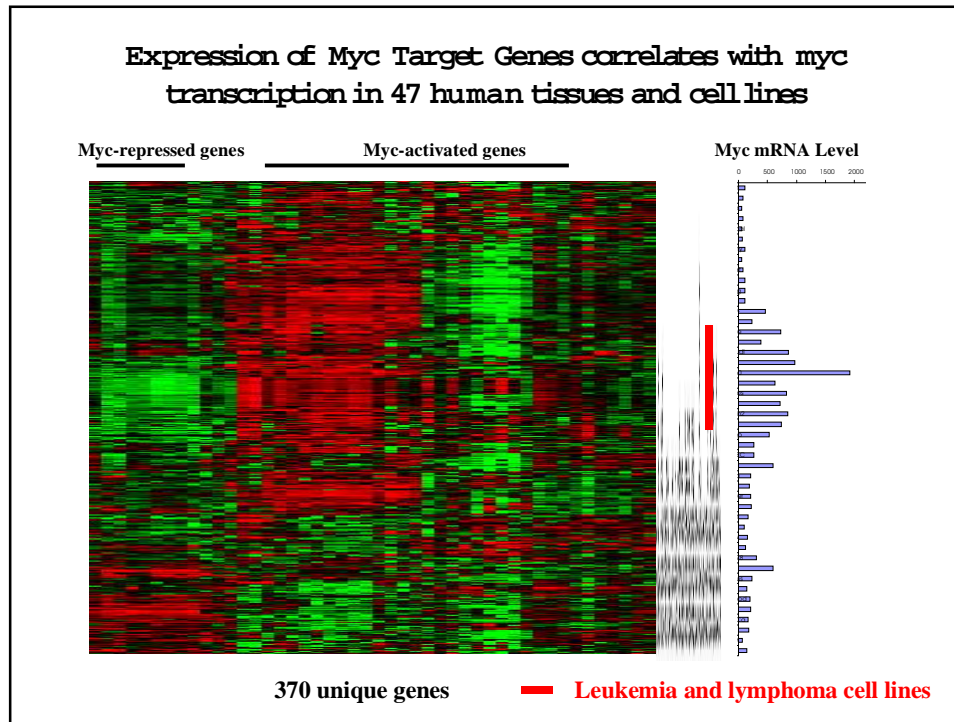

Dissecting the Myc Regulation Network Using Promoter Microarrays

Dissecting the Myc Regulation Network Using Promoter Microarrays

Dissecting the Myc Regulation Network Using Promoter Microarrays

Summary

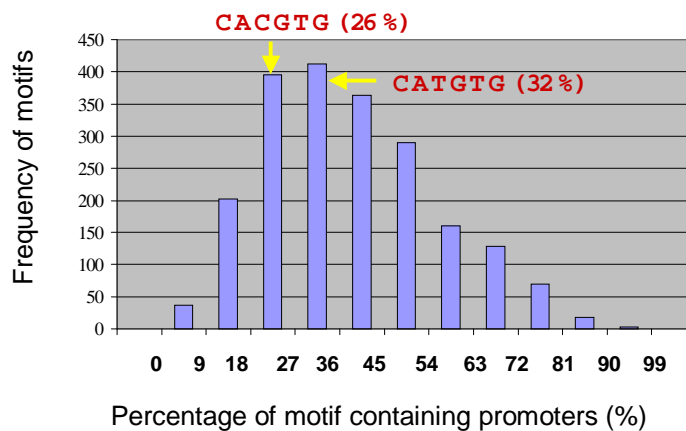

- Genome wide location analysis is a general method for transcription factor target identification
- Myc/Max bind to a large number of gene promoters in Burkitt's lymphoma cells
- A majority of the c-myc target genes appear to be actively transcribed in the Burkitt's lymphoma cells
- A small number of c-myc target genes appear to be negatively regulated by this protein

Dissecting the Myc Regulation Network Using Promoter Microarrays

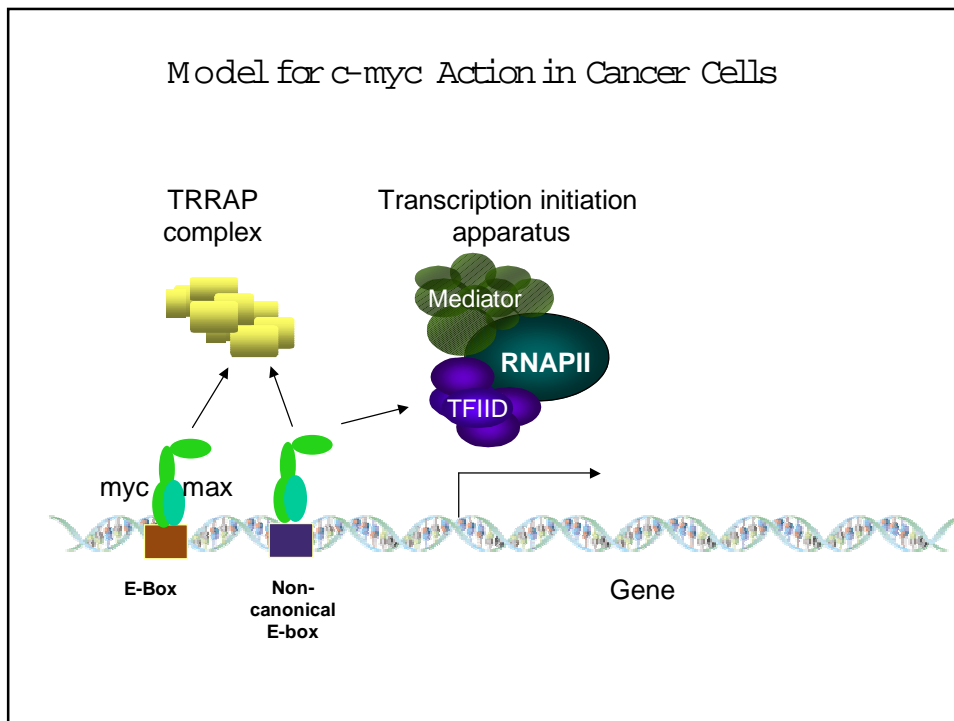

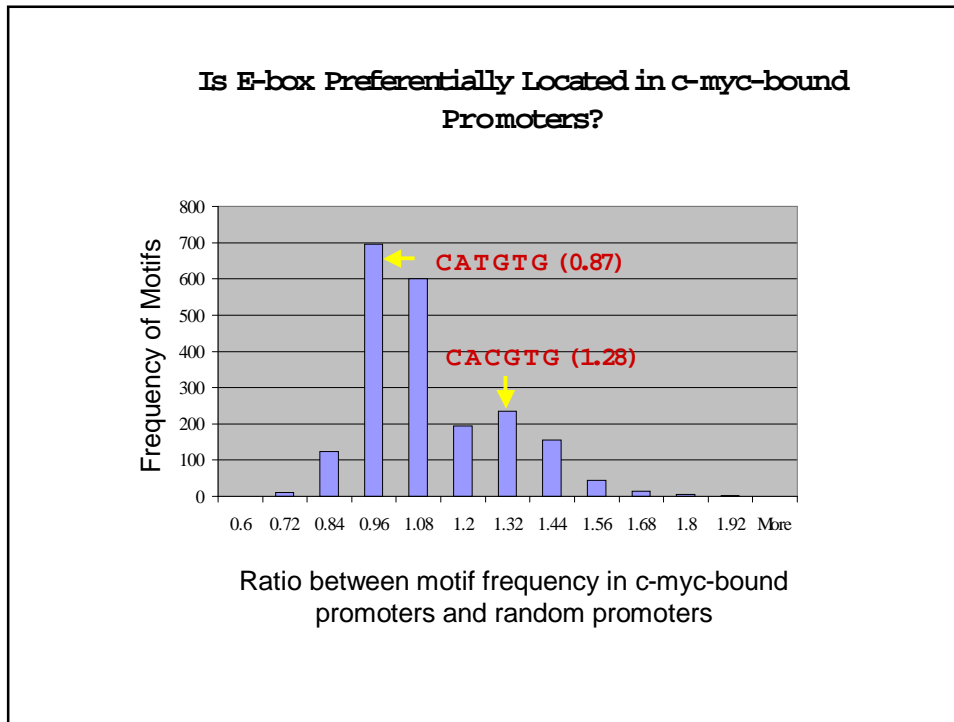

Sequences that specify c-myc binding to its target promoters

- Is E-box alone responsible for c-myc's specificity?
- Are there other DNA elements responsible for c-myc binding specificity?
- Other mechanisms that determine c-myc binding specificity in vivo?

Frequency Distribution of All Possible 6-mer Motifs in c-myc-bound Promoters

Dissecting the Myc Regulation Network Using Promoter Microarrays

Dissecting the Myc Regulation Network Using Promoter Microarrays

Summary

- E-box alone can not explain the specificity of c-myc binding to target promoters
- In vivo binding of c-myc to gene promoters may involve c-myc/non-canonical E-box interactions
- C-myc binding to gene promoter may also involve mechanisms other than specific protein/DNA interactions

Future work

- Capturing a snap shot of the transcriptional regulatory network in mammalian cells
- Identifying the mechanisms that govern in vivo binding specificity of transcription factors
- Integrating protein-protein, protein-DNA, mRNA data

Dissecting the Myc Regulation Network Using Promoter Microarrays
