The Galaxy-Halo Connection: Semi-Analytic Models

Andrew Benson

The Carnegie Observatories

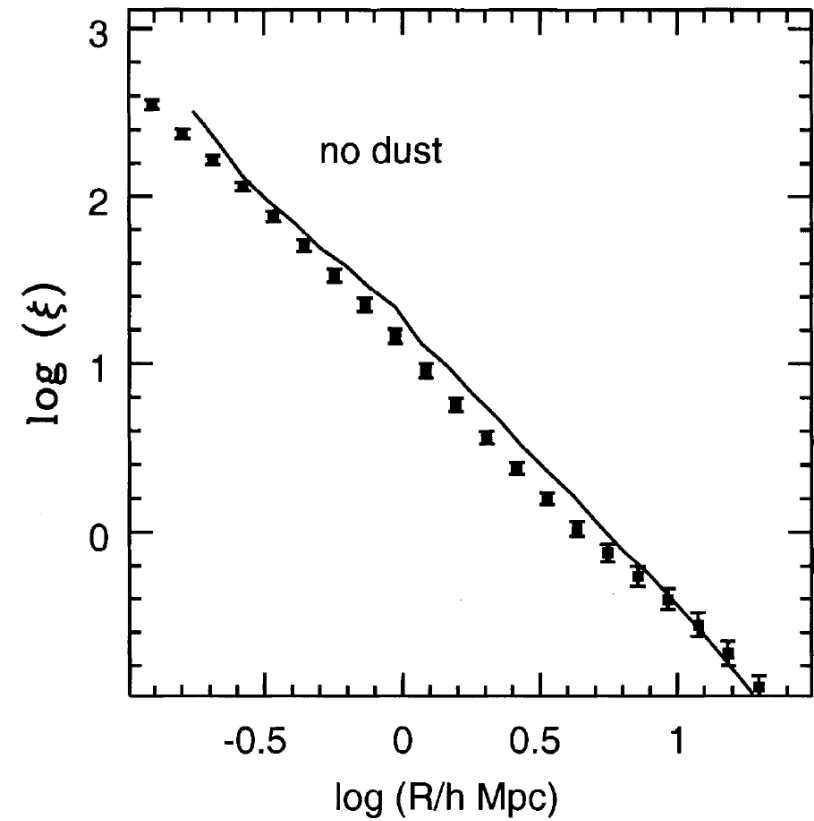

Challenge.....

Origins in work attempting to use the galaxy distribution to test the CDM hypothesis, and constrain cosmological parameters:

Clearly, what is now required is a proper physical model for galaxy formation which can be grafted onto simulations to see if the distribution of our “galaxies” is indeed realistic.

– *Davis, Efstathiou, Frenk & White (1985; ApJ; 292; 371)*

....Accepted

Kauffman et al. (1999)

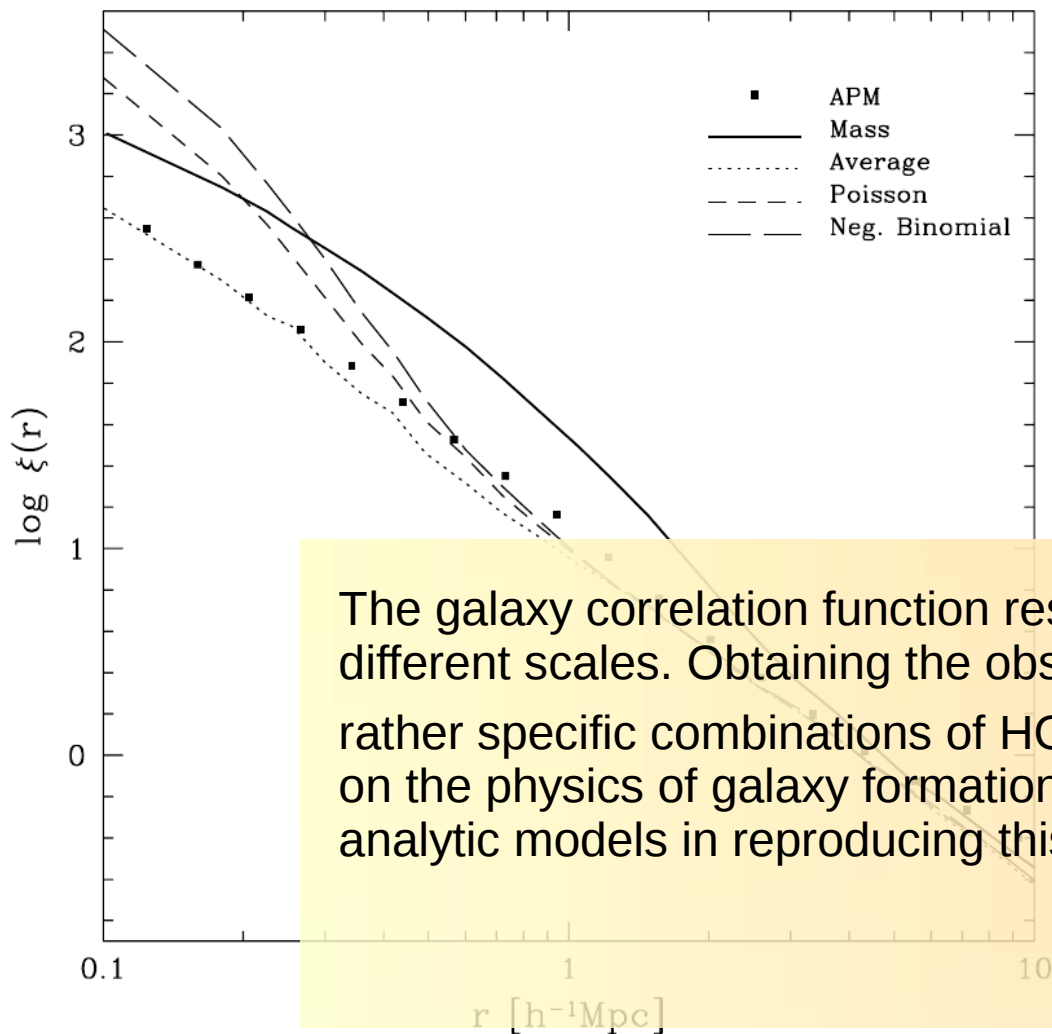

Benson et al. (2000)

Connection to the HOD

Berlind & Weinberg (2002; ApJ; 575; 587)

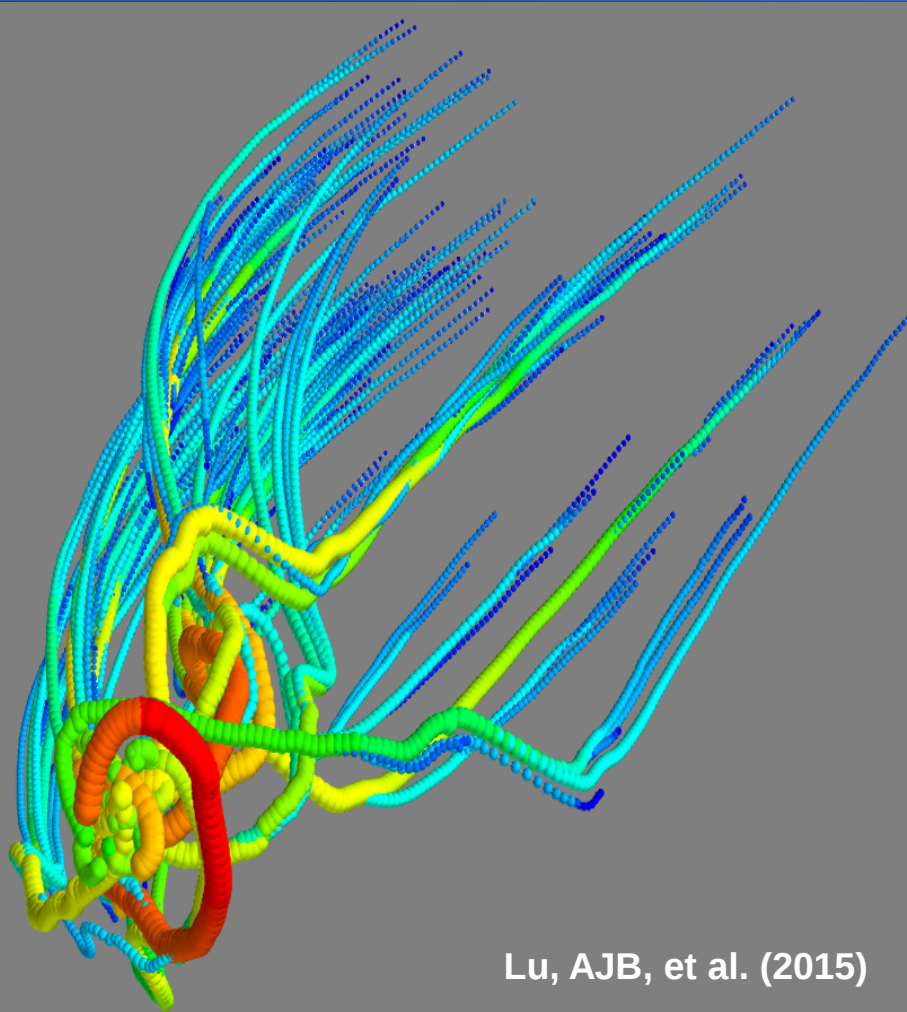

Connection to the HOD

The galaxy correlation function responds to different aspects of $P(N|M)$ on different scales. Obtaining the observed power-law form of $\xi_g(r)$ requires rather specific combinations of HOD parameters, implying a strong constraint on the physics of galaxy formation; the success of numerical and semi-analytic models in reproducing this form is entirely non-trivial.

– Berlind & Weinberg (2002; *ApJ*; 575; 587)

What Does “Semi-Analytic” Mean Anyway?

- Attempt to model some coarse-grained properties of galaxies:
 - Mass of stars
 - Mass of ISM
 - Characteristic size
- Describe evolution by some set of ODEs, plus impulsive events (mergers)
- Solve that system along branches of merger trees

ODEs: Mass

$$\begin{aligned}
 \dot{M}_v &= +\dot{M}_{v,\text{tree}} & , \\
 \dot{M}_f &= +\dot{M}_{\text{sup}} - \dot{M}_{\text{rec}} & , \\
 \dot{M}_h &= +\dot{M}_{\text{IGM}} + \dot{M}_{\text{rec}} - \dot{M}_{\text{inf}} + \dot{M}_{\text{inc}} - \dot{M}_{\text{str}} - \dot{M}_{\bullet,\text{acc,h}} - \dot{M}_{\bullet,\text{rdo}} & , \\
 \dot{M}_o &= -\dot{M}_{\text{inc}} + \sum \dot{M}'_{\text{str}} + \sum_i (1 - f_{\text{str}}) \dot{M}_{\text{out},i} + \sum_i f'_{\text{str}} \dot{M}'_{\text{out},i} + \dot{M}_{\bullet,\text{qsr}} & , \\
 \dot{M}_{d,g} &= +\dot{M}_{\text{inf}} - \dot{M}_{\text{sf,d}} - \dot{M}_{\text{out,d}} - \dot{M}_{g,\text{ins}} & , \\
 \dot{M}_{d,\star} &= +\dot{M}_{\text{sf,d}} - \dot{M}_{\star,\text{ins}} & , \\
 \dot{M}_{s,g} &= -\dot{M}_{\text{sf,s}} - \dot{M}_{\text{out,s}} + \dot{M}_{g,\text{ins}} - \dot{M}_{\bullet,\text{acc,s}} - \dot{M}_{\bullet,\text{qsr}} & , \\
 \dot{M}_{s,\star} &= +\dot{M}_{\text{sf,s}} + \dot{M}_{\star,\text{ins}} & , \\
 \dot{M}_{\bullet} &= +\sum_j \dot{M}'_{\bullet,\text{acc},j} - \dot{M}_{\bullet,\text{jet}} . &
 \end{aligned}$$

ODEs: Metals

$$\begin{aligned}
 \dot{M}_{Z,h} &= -\dot{M}_{Z,inf} + \dot{M}_{Z,inc} - \dot{M}_{Z,str} && -\dot{M}_{Z,\bullet,acc,h} - \dot{M}_{Z,\bullet,rdo}, \\
 \dot{M}_{Z,o} &= -\dot{M}_{Z,inc} + \sum \dot{M}'_{Z,str} && + \sum_i (1 - f_{str}) \dot{M}_{Z,out,i} + \sum_i f'_{str} \dot{M}'_{Z,out,i} + \dot{M}_{Z,\bullet,qsr}, \\
 \dot{M}_{Z,d,g} &= +\dot{M}_{Z,inf} && -\dot{M}_{Z,sf,d} + \dot{M}_{Z,yld,d} - \dot{M}_{Z,out,d} - \dot{M}_{Z,g,ins}, \\
 \dot{M}_{Z,d,\star} &= && +\dot{M}_{Z,sf,d} - \dot{M}_{Z,\star,ins}, \\
 \dot{M}_{Z,s,g} &= && -\dot{M}_{Z,sf,s} + \dot{M}_{Z,yld,s} - \dot{M}_{Z,out,s} + \dot{M}_{Z,g,ins} - \dot{M}_{Z,\bullet,acc,s} - \dot{M}_{Z,\bullet,qsr}, \\
 \dot{M}_{Z,s,\star} &= && +\dot{M}_{Z,sf,s} + \dot{M}_{Z,\star,ins},
 \end{aligned} \tag{A6}$$

ODEs: Angular Momentum

$$\begin{aligned}
 \dot{J}_h &= +\dot{J}_{\text{IGM}} + \dot{J}_{\text{rec}} - \dot{J}_{\text{inf}} + \dot{J}_{\text{inc}} - \dot{J}_{\text{str}} - \dot{J}_{\bullet, \text{acc}, \text{h}} - \dot{J}_{\bullet, \text{rdo}}, \\
 \dot{J}_o &= -\dot{J}_{\text{inc}} + \sum \dot{J}'_{\text{str}} + \sum_i (1 - f_{\text{str}}) \dot{J}_{\text{out}, i} + \sum_i f'_{\text{str}} \dot{J}'_{\text{out}, i} + \dot{J}_{\bullet, \text{qsr}}, \\
 \dot{J}_{\text{d}, \text{g}} &= +\dot{J}_{\text{inf}} - \dot{J}_{\text{out}, \text{d}} - \dot{J}_{\text{g}, \text{ins}}, \\
 \dot{J}_{\text{d}, \star} &= -\dot{J}_{\star, \text{ins}}, \\
 \dot{J}_{\text{s}, \text{g}} &= -\dot{J}_{\text{out}, \text{s}} + \dot{J}_{\text{g}, \text{ins}} - \dot{J}_{\bullet, \text{acc}, \text{s}} - \dot{J}_{\bullet, \text{qsr}}, \\
 \dot{J}_{\text{s}, \star} &= +\dot{J}_{\star, \text{ins}}, \\
 \dot{a}_{\bullet} &= +\sum_j \dot{a}_{\bullet, \text{acc}, j} - \dot{a}_{\bullet, \text{jet}}.
 \end{aligned}$$

What Does “Semi-Analytic” Mean Anyway?

- Forward modeling is crucial, and a primary strength of semi-analytic modeling
- Allows:
 - Incorporation of physical models
 - Prediction of complex joint distributions
 - Modeling of observational selection effects
 - Interpretation of data

Galaxy-Halo Connection: Goals/Applications

- Survey Simulation
 - Necessary to define and calibrate surveys
 - LSST
 - WFIRST
 - Euclid
 - Allow for accurate/robust marginalization
- Galaxy Physics
 - How galaxies populate halos is *one of the keys* to understanding galaxy formation

Challenges

- Incomplete understanding of galaxy formation physics
- Resolution (mass/time)
- Numerical robustness/convergence
- Calibration

Orphans

Robustness

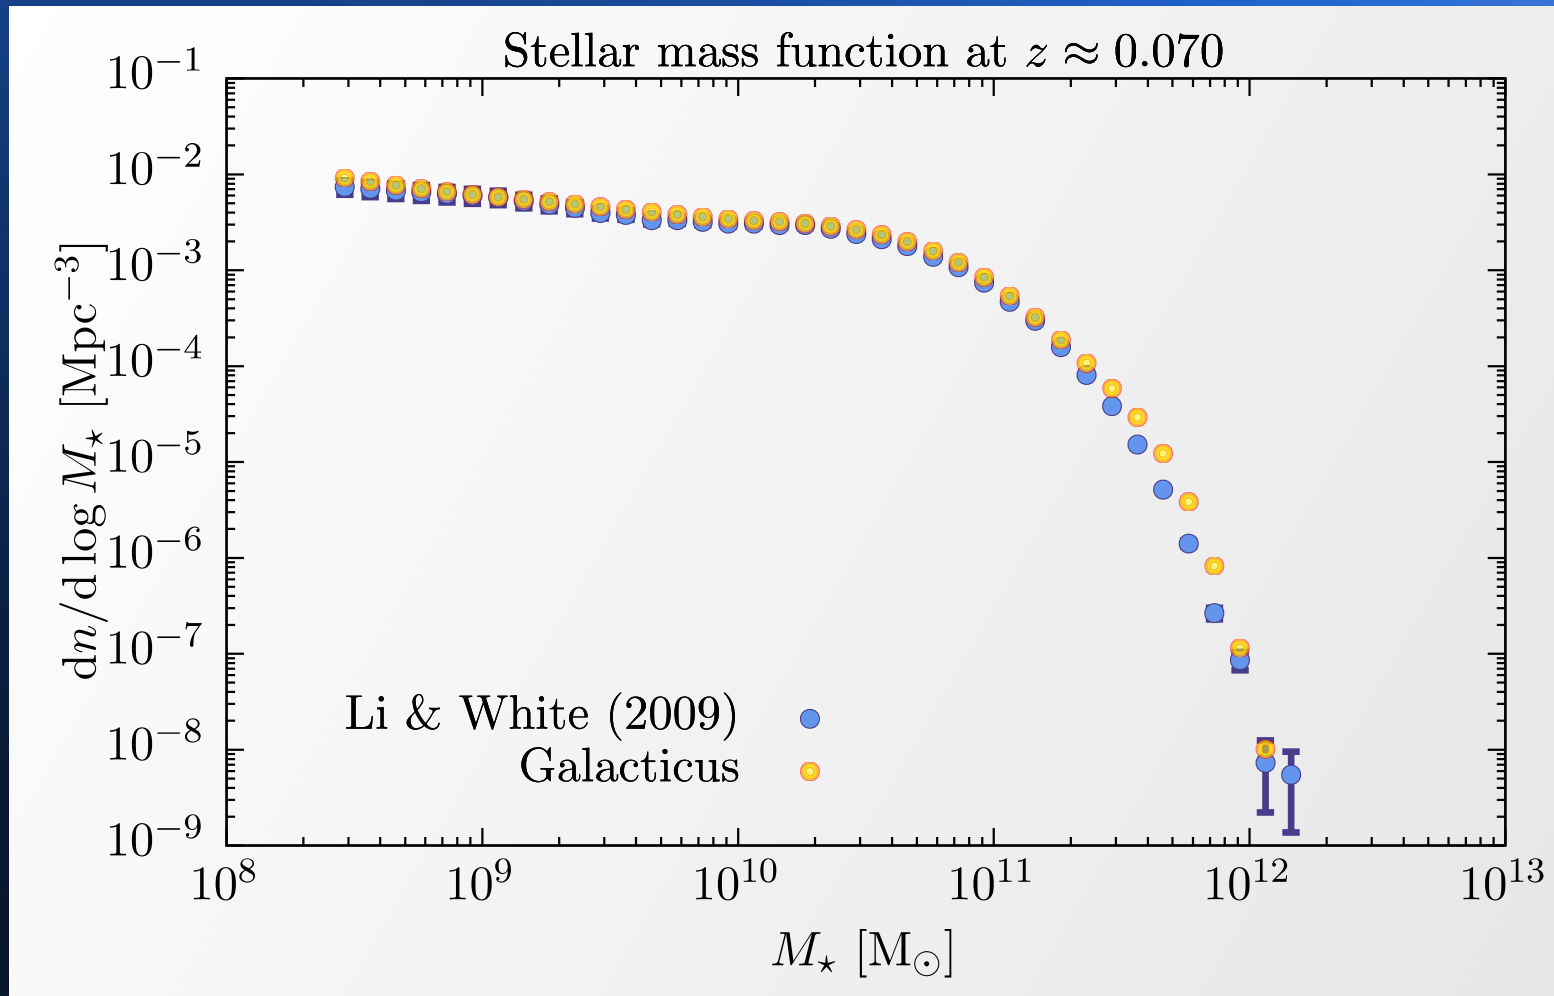

Pujol et al. (2017)

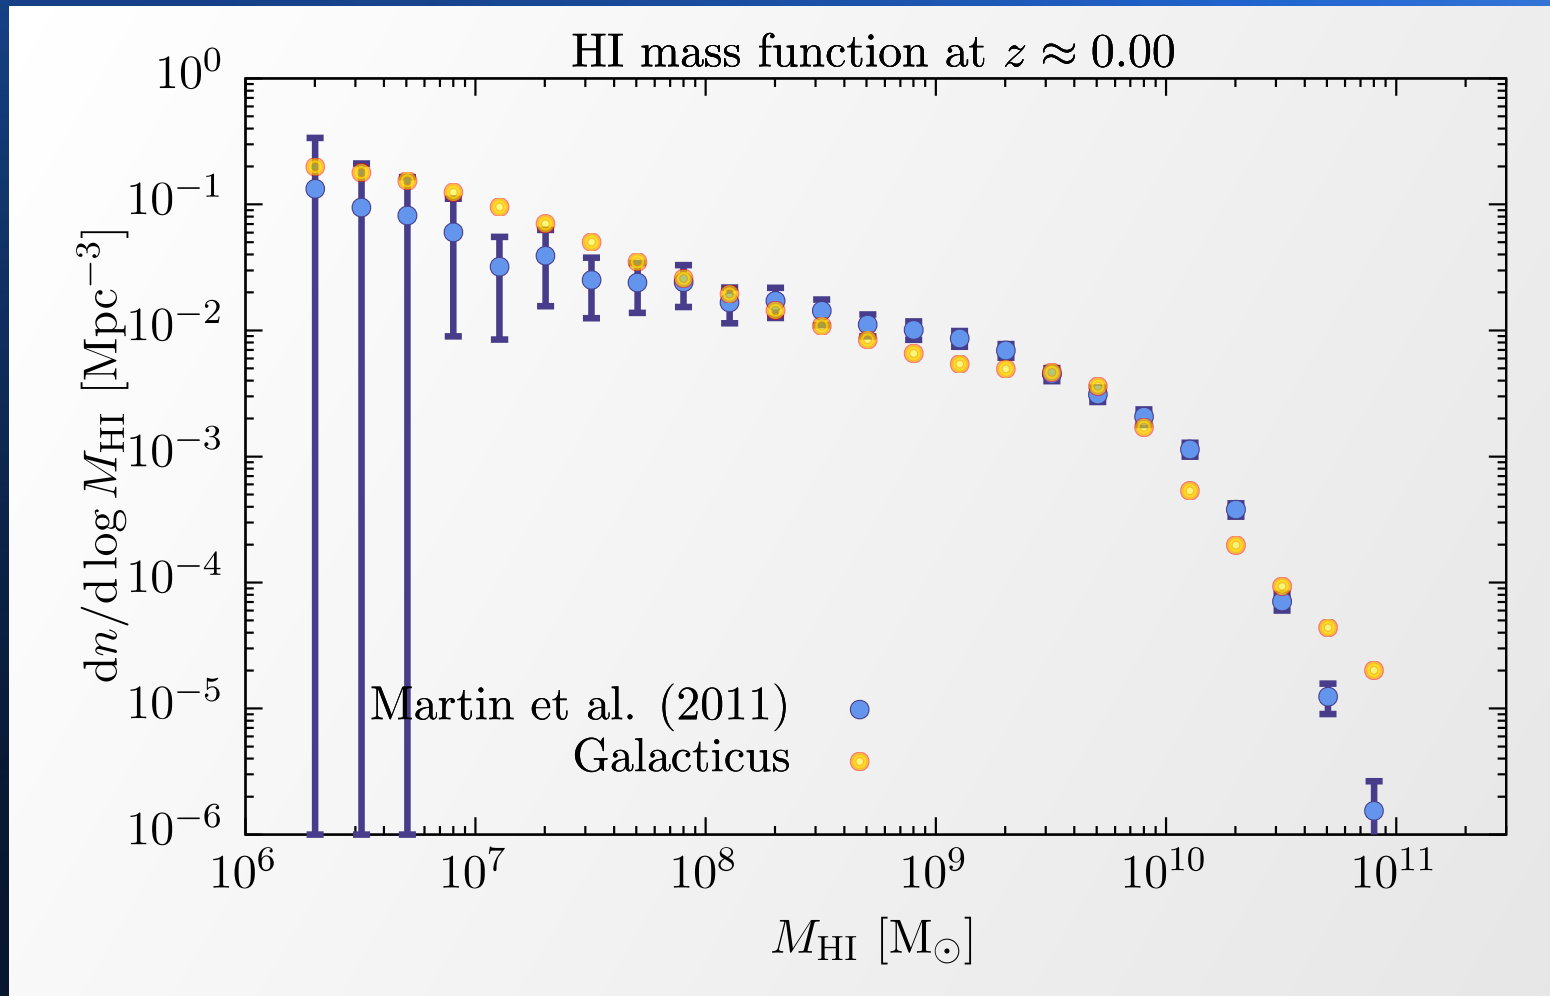

Constraints

- Ongoing work to provide precise calibrations to key physical properties (stellar mass, HI mass, sizes, clustering)
- Careful consideration of:
 - Covariances
 - Systematics
 - Observational biases/errors

Constrained models...

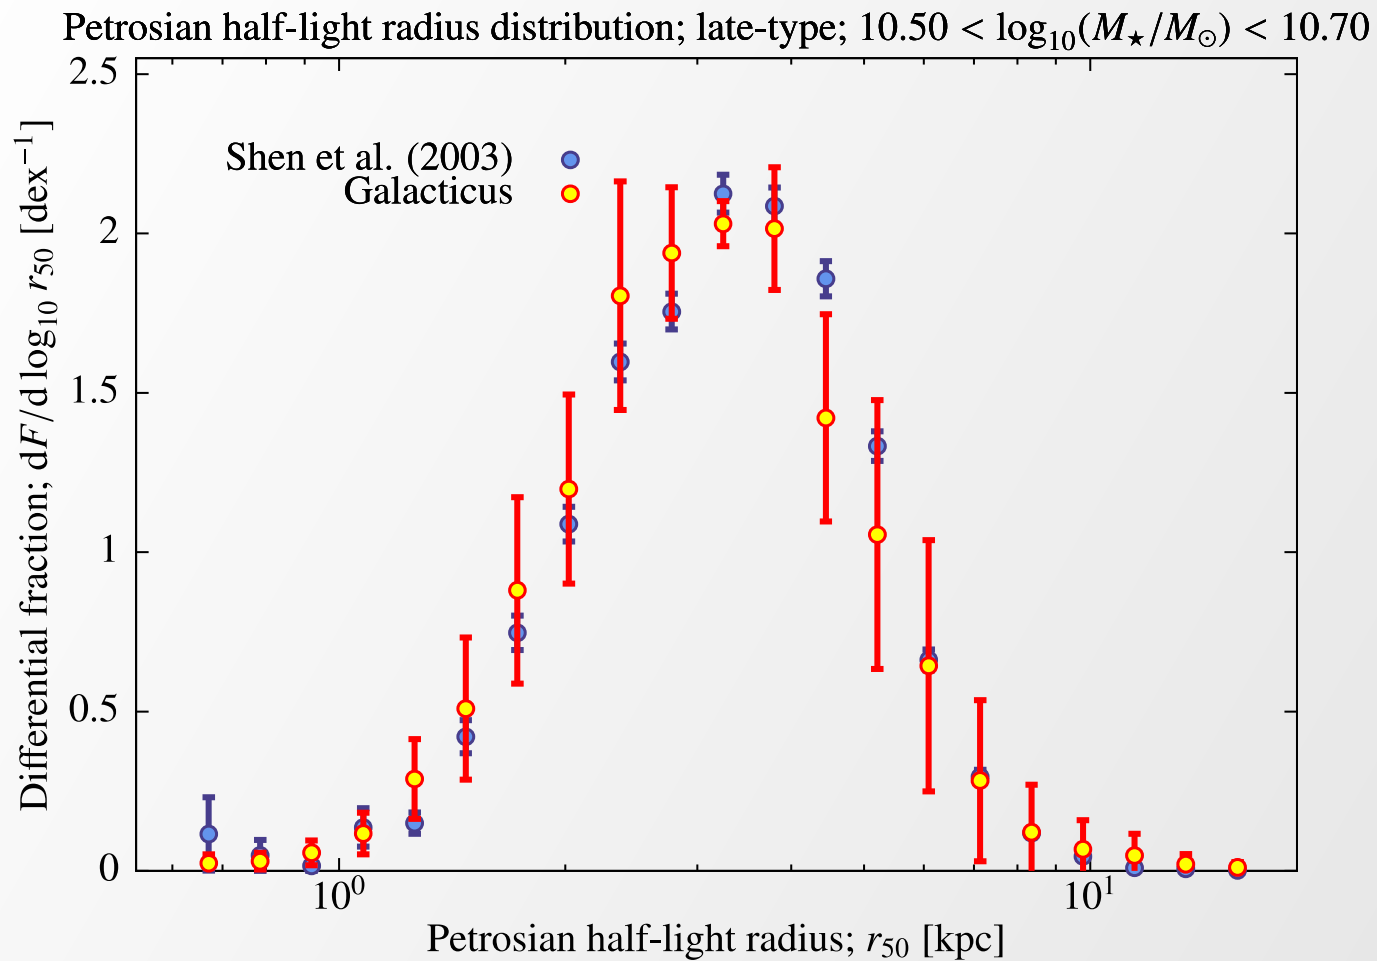

Constrained models...

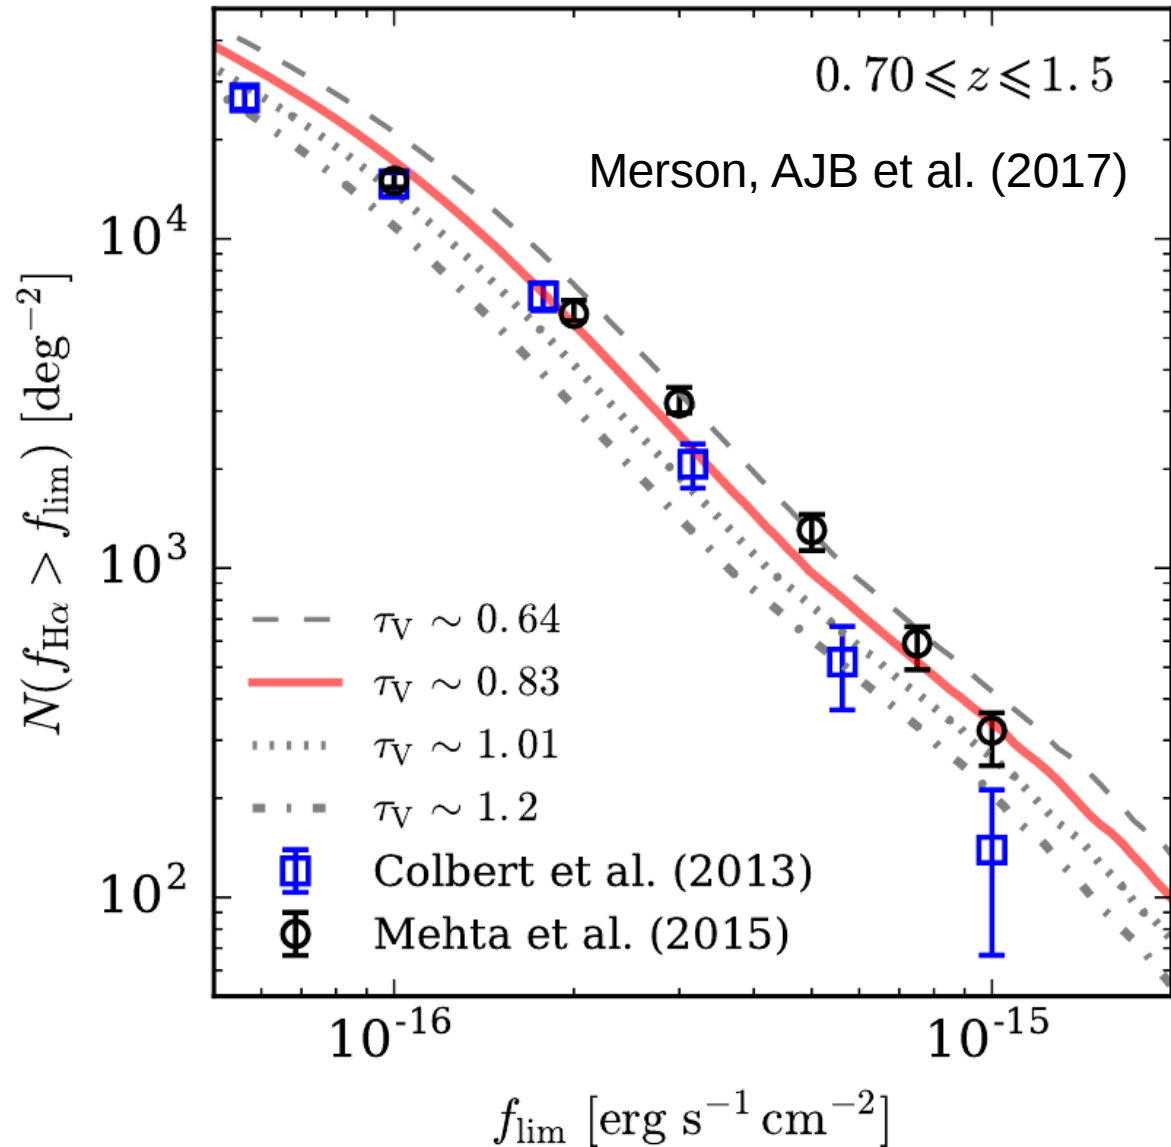

Constrained models...

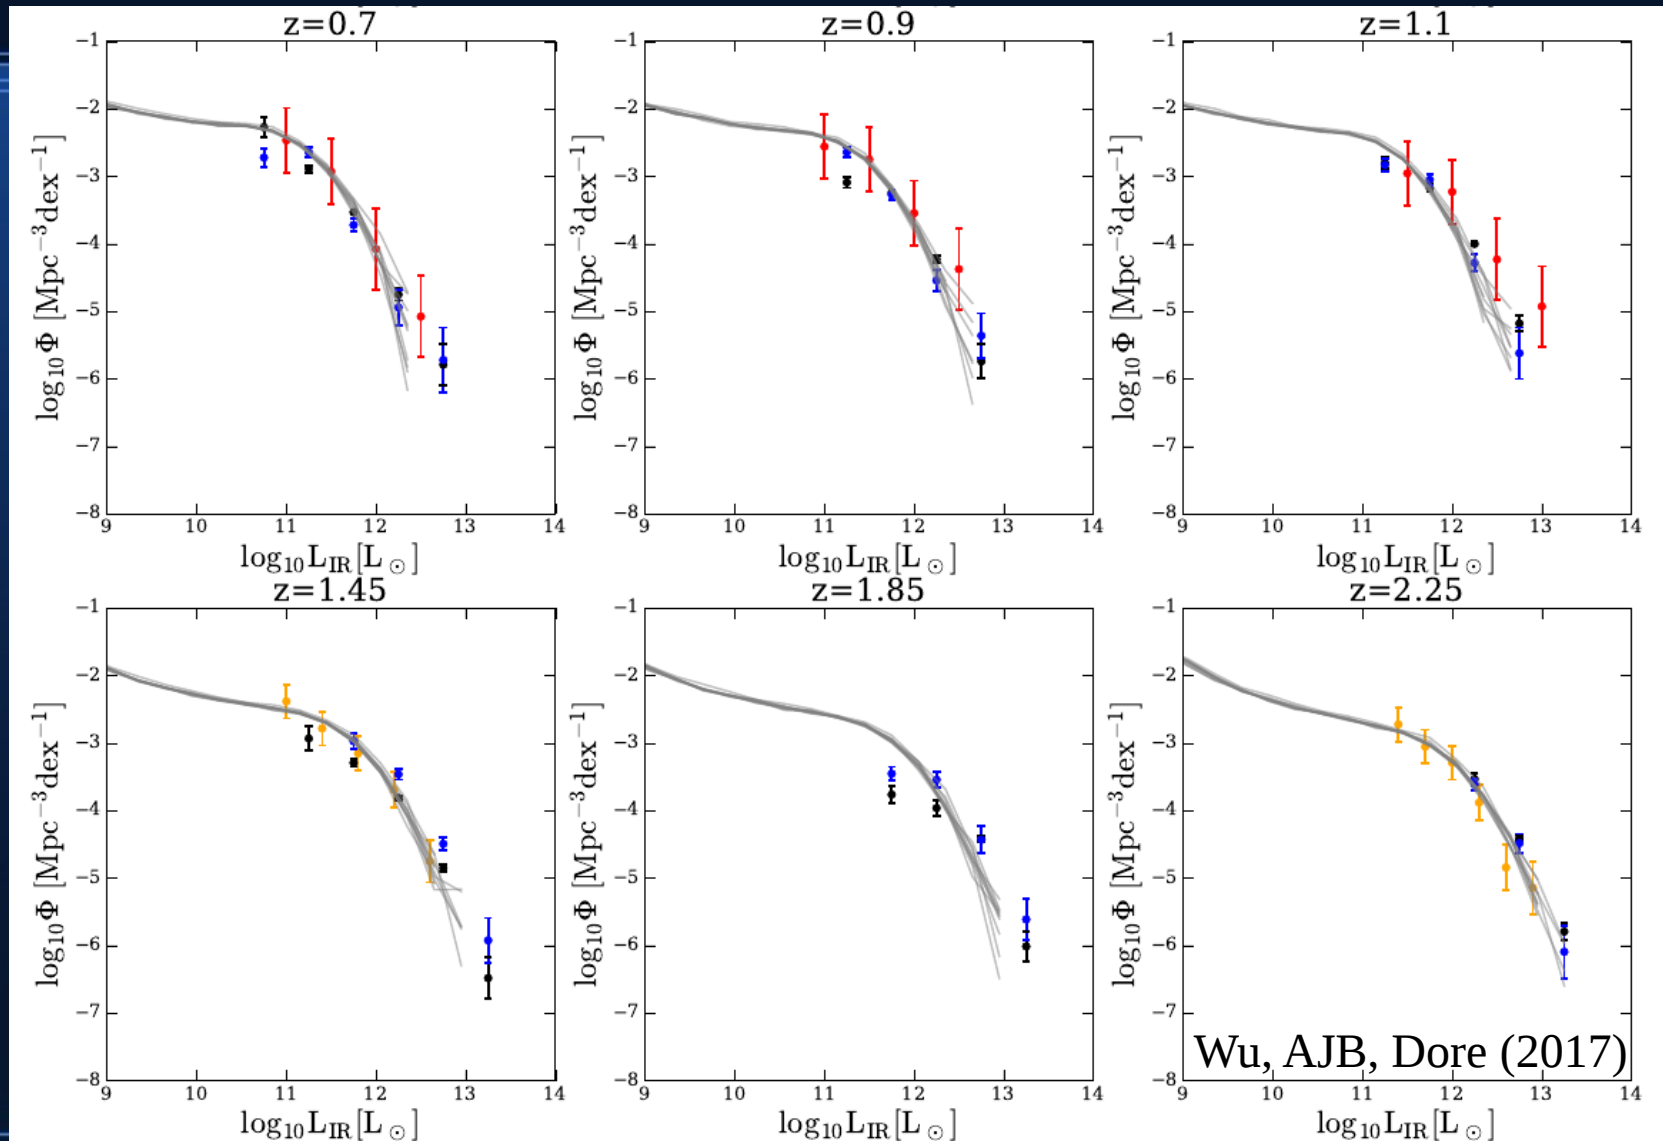

Constrained models...

Emission Line Surveys

Infrared Luminosity Functions

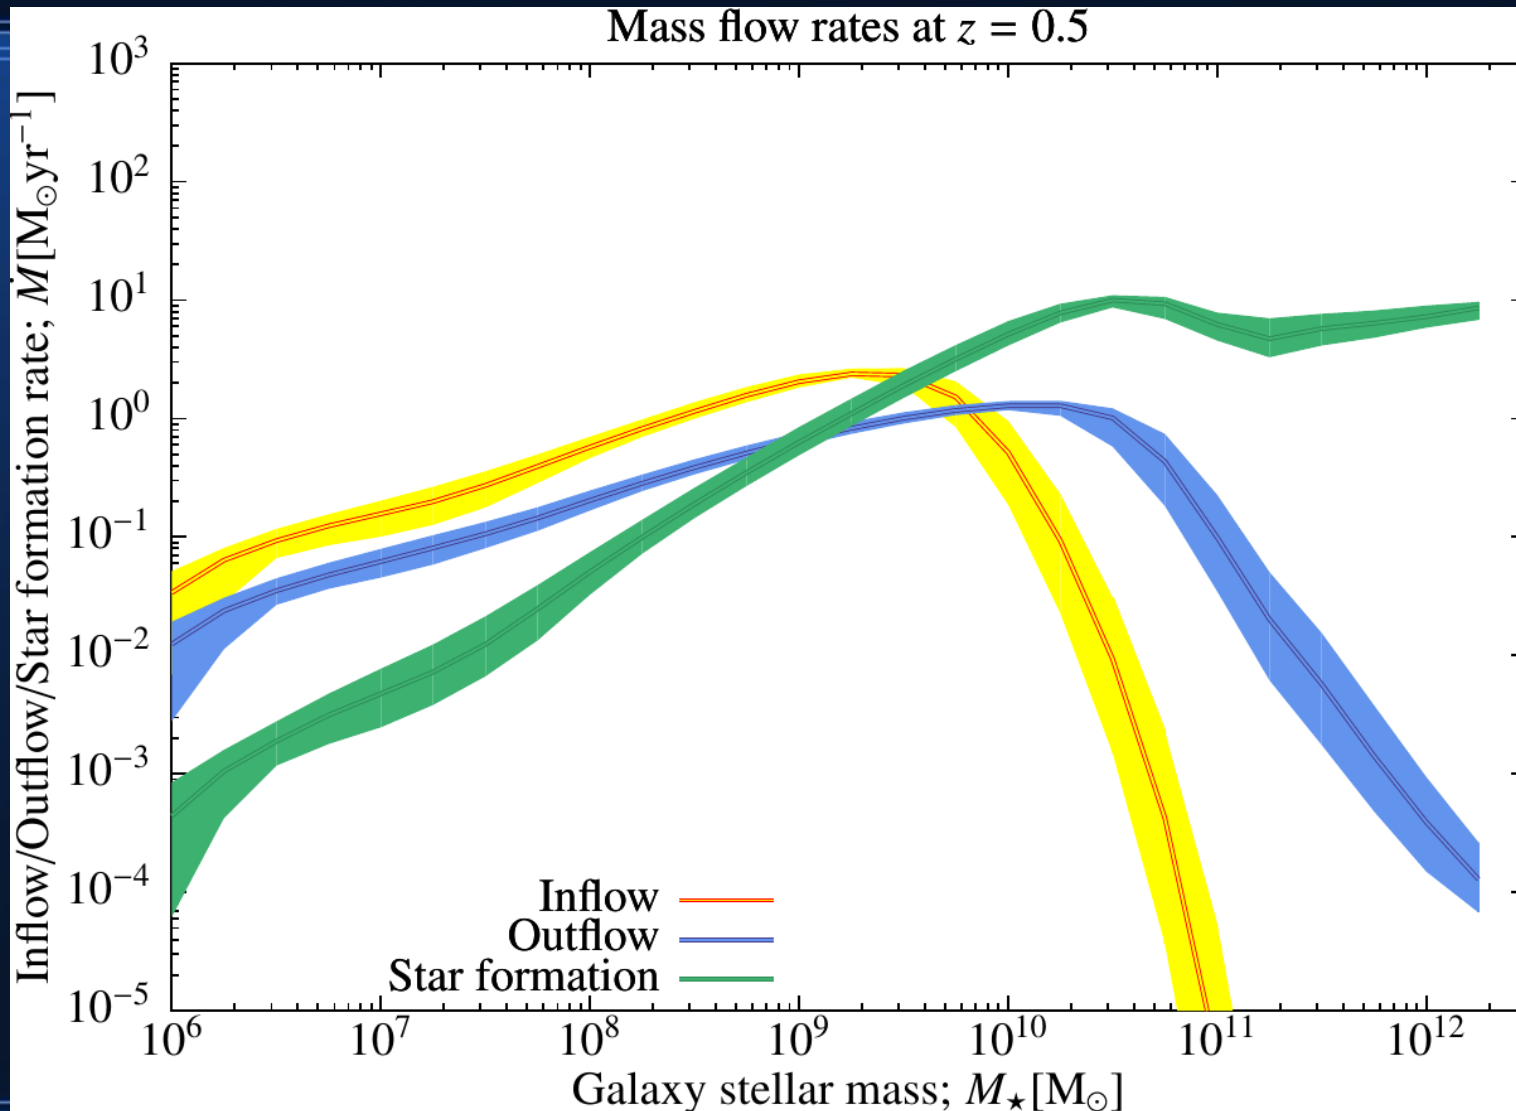

Infrared Number Counts

Inflow/Outflow

Inflow/Outflow

Conclusions

- Semi-analytic models
 - Attempt to predict galaxy-halo connection *ab initio*
 - But, limited by understanding of galaxy physics...
 - ...and ability to accurately constrain
 - Potential to provide insight into the physics of galaxy formation via galaxy-halo connection
