

TRINITY: Empirical Dark Matter Halo—Galaxy— Supermassive Black Hole Connection from $z = 0 - 10$

Haowen Zhang (张昊文),

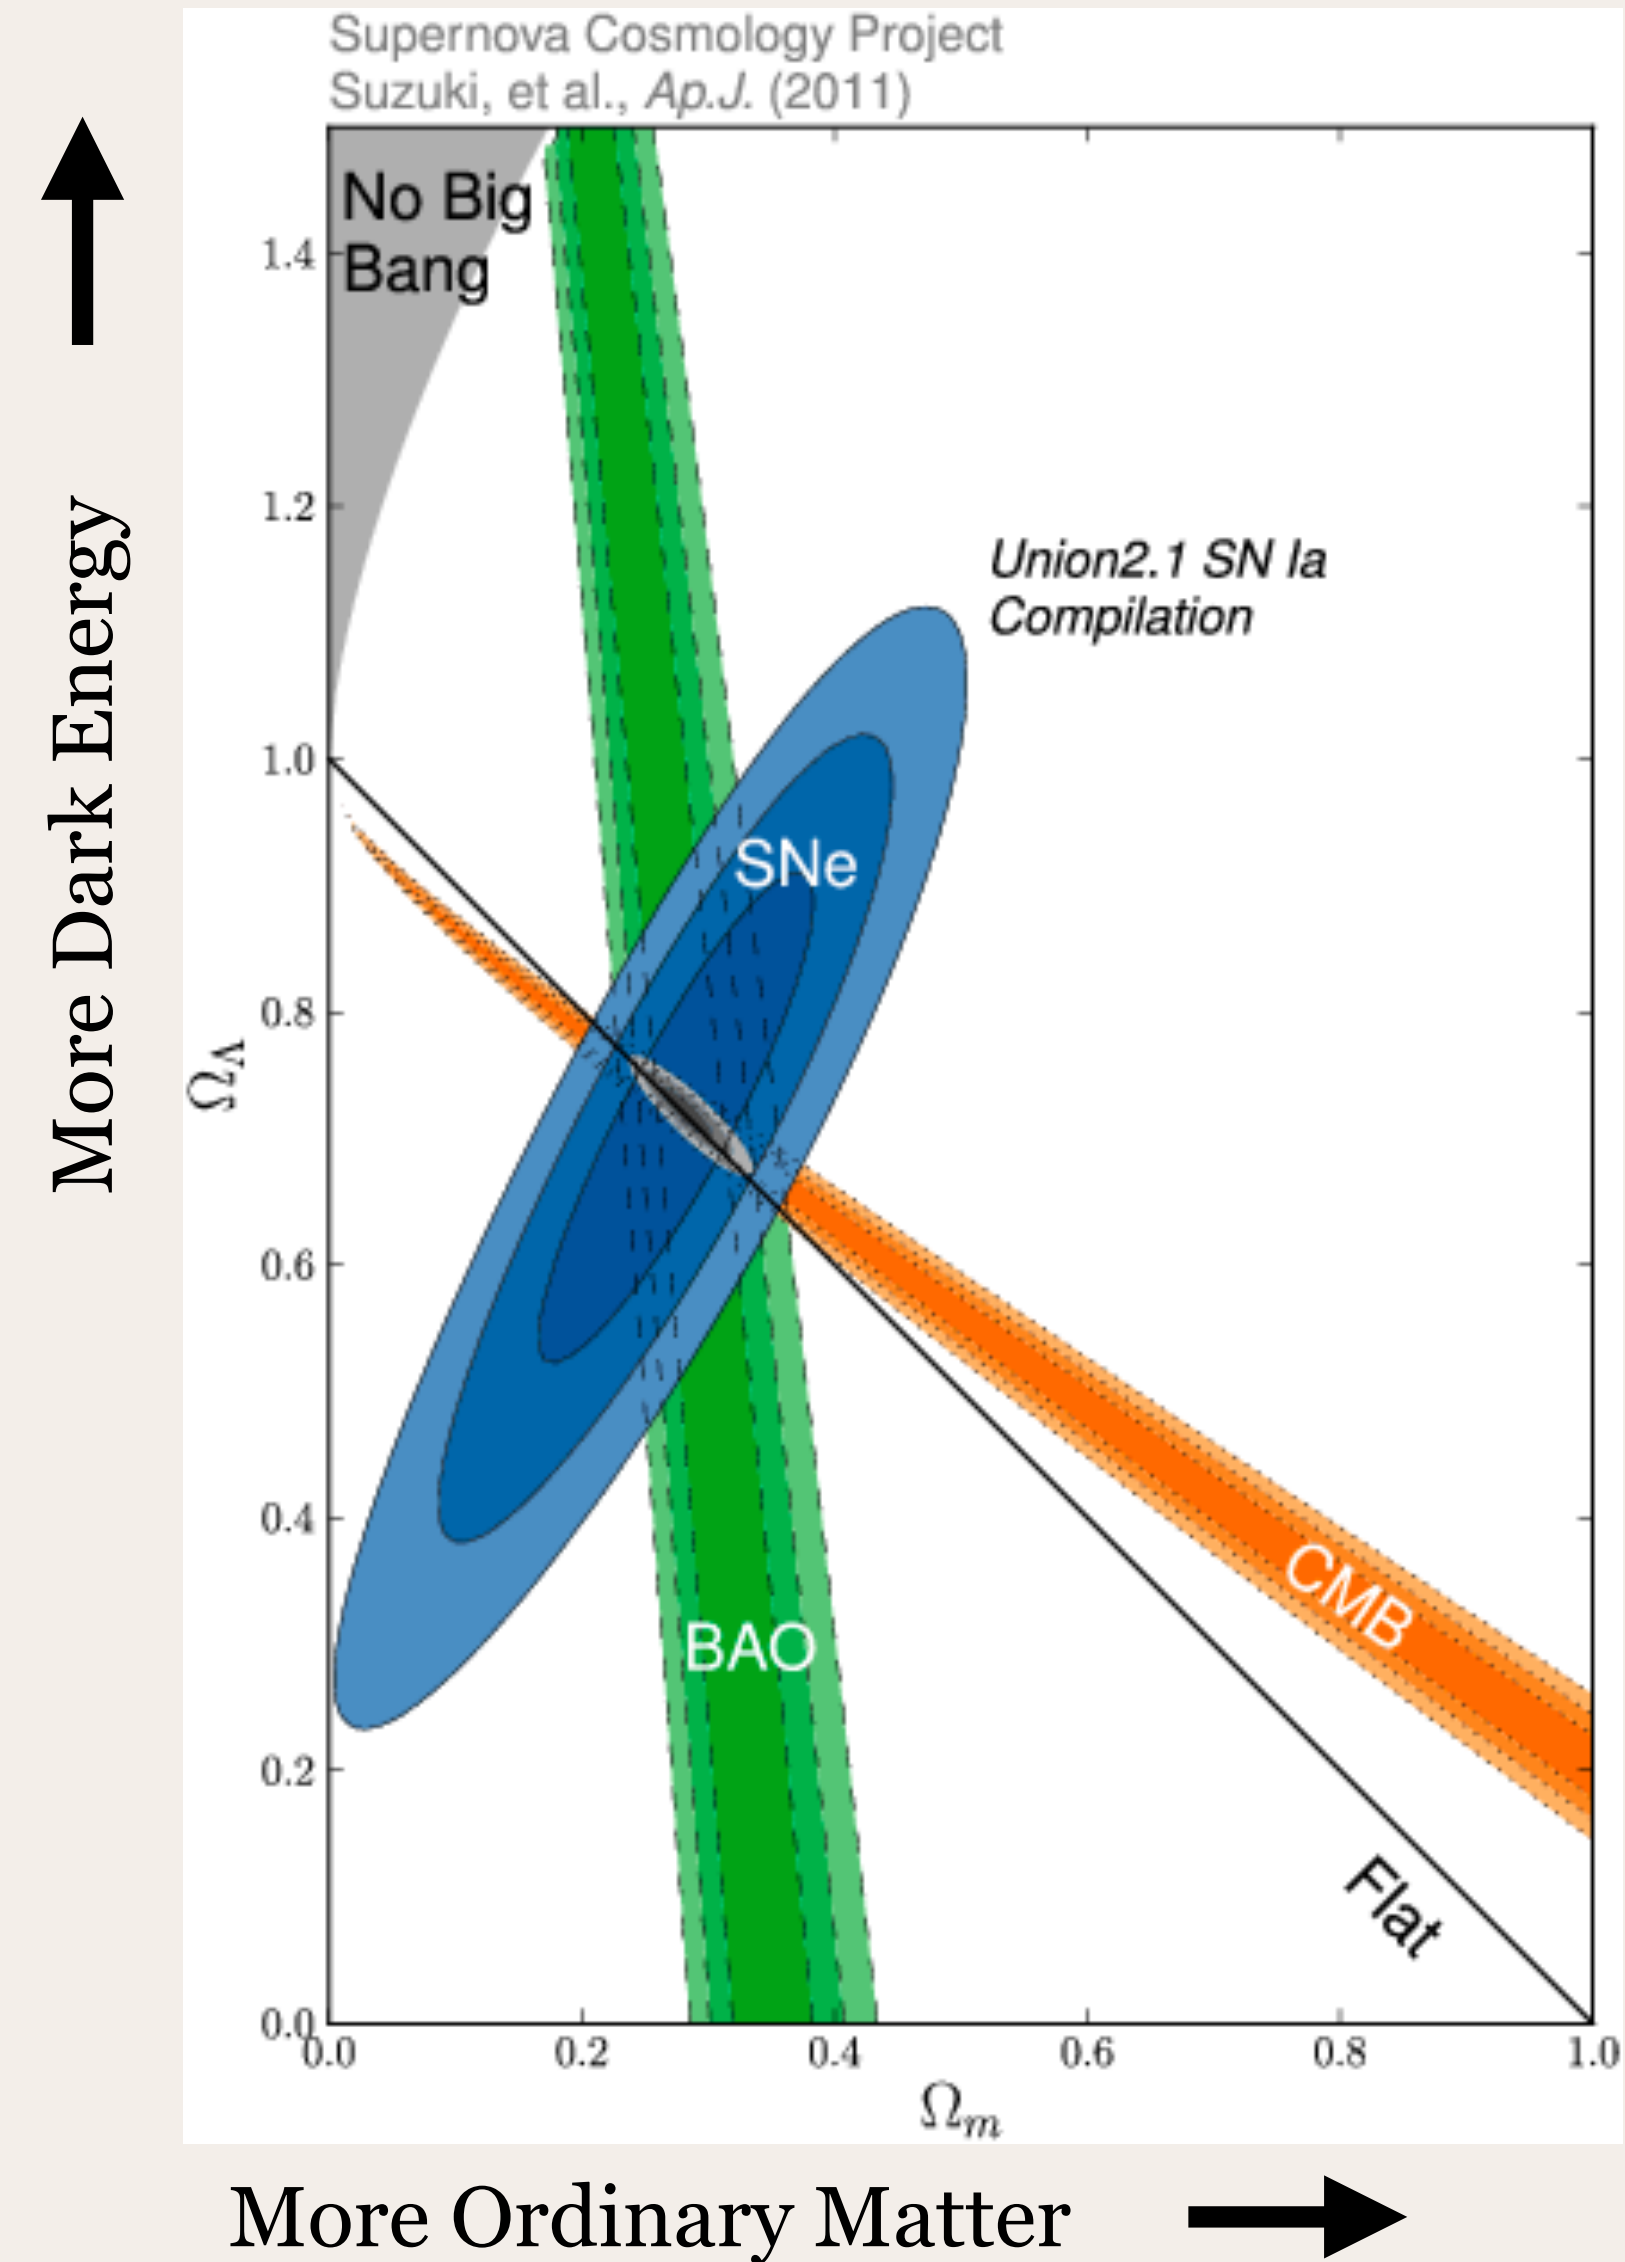

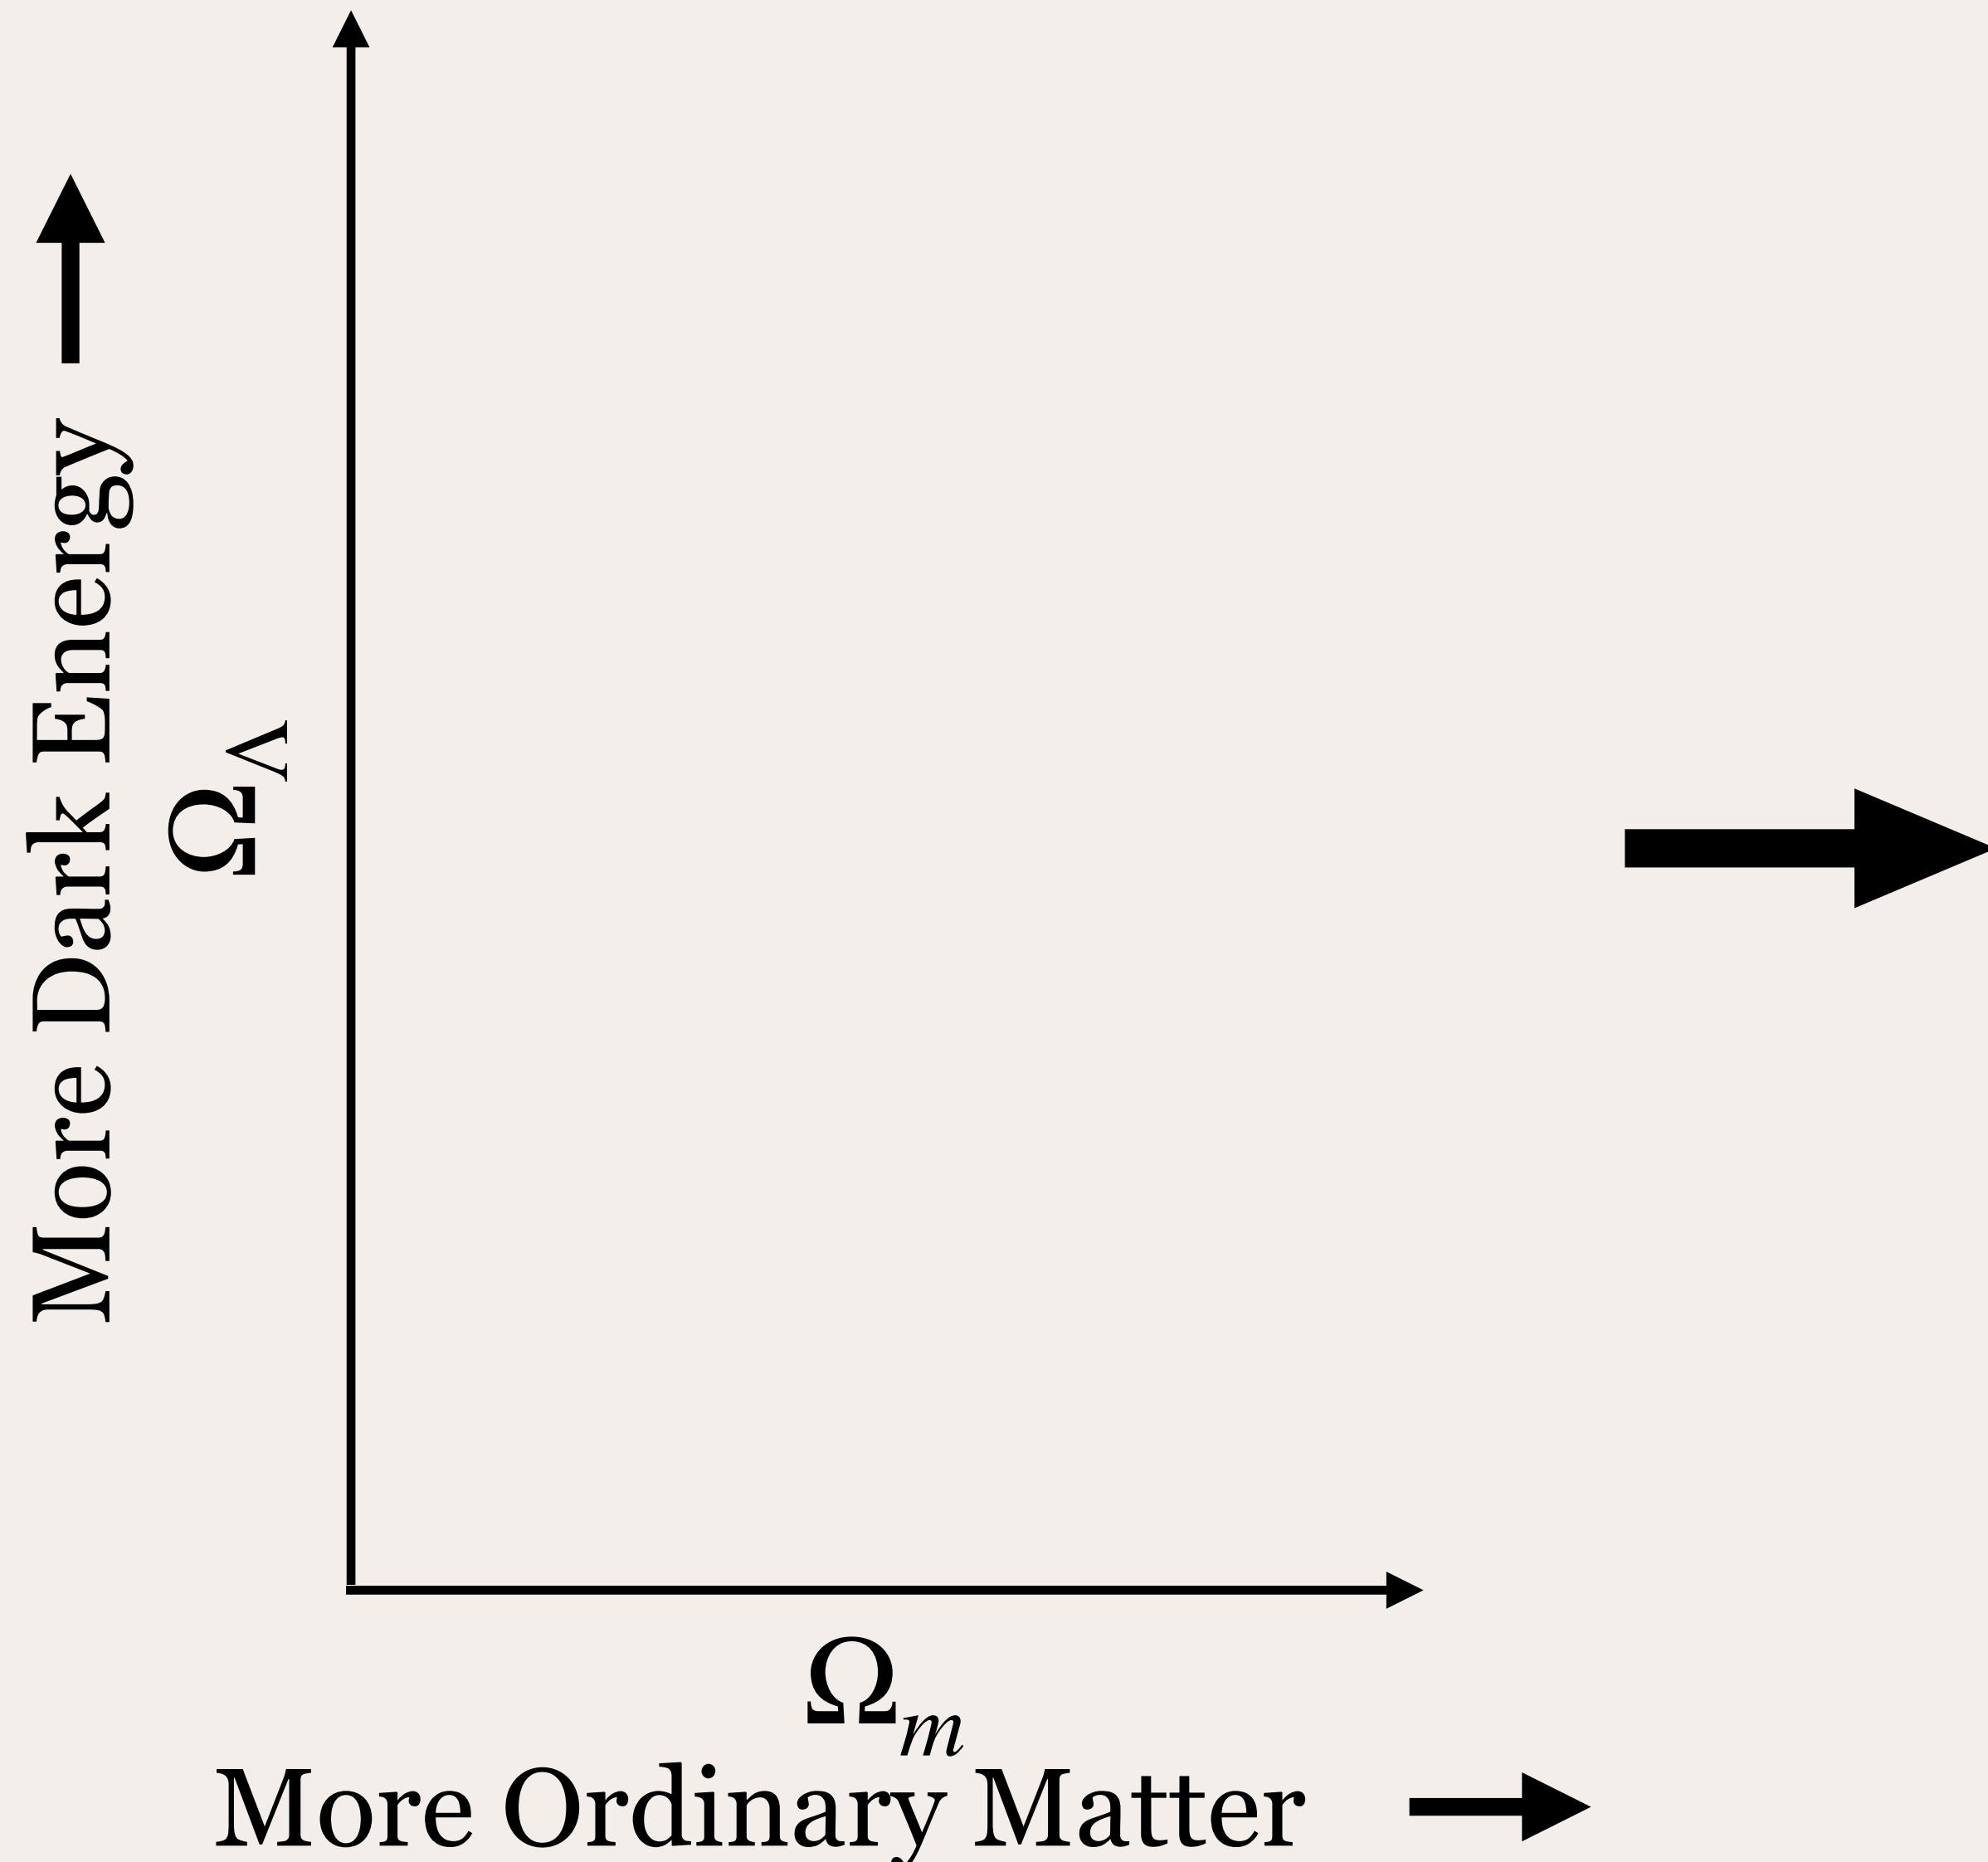

Advisor: Peter Behroozi,

Collaborators: Marta Volonteri, Joseph Silk, Xiaohui Fan, Phil Hopkins, Jinyi Yang, and James Aird

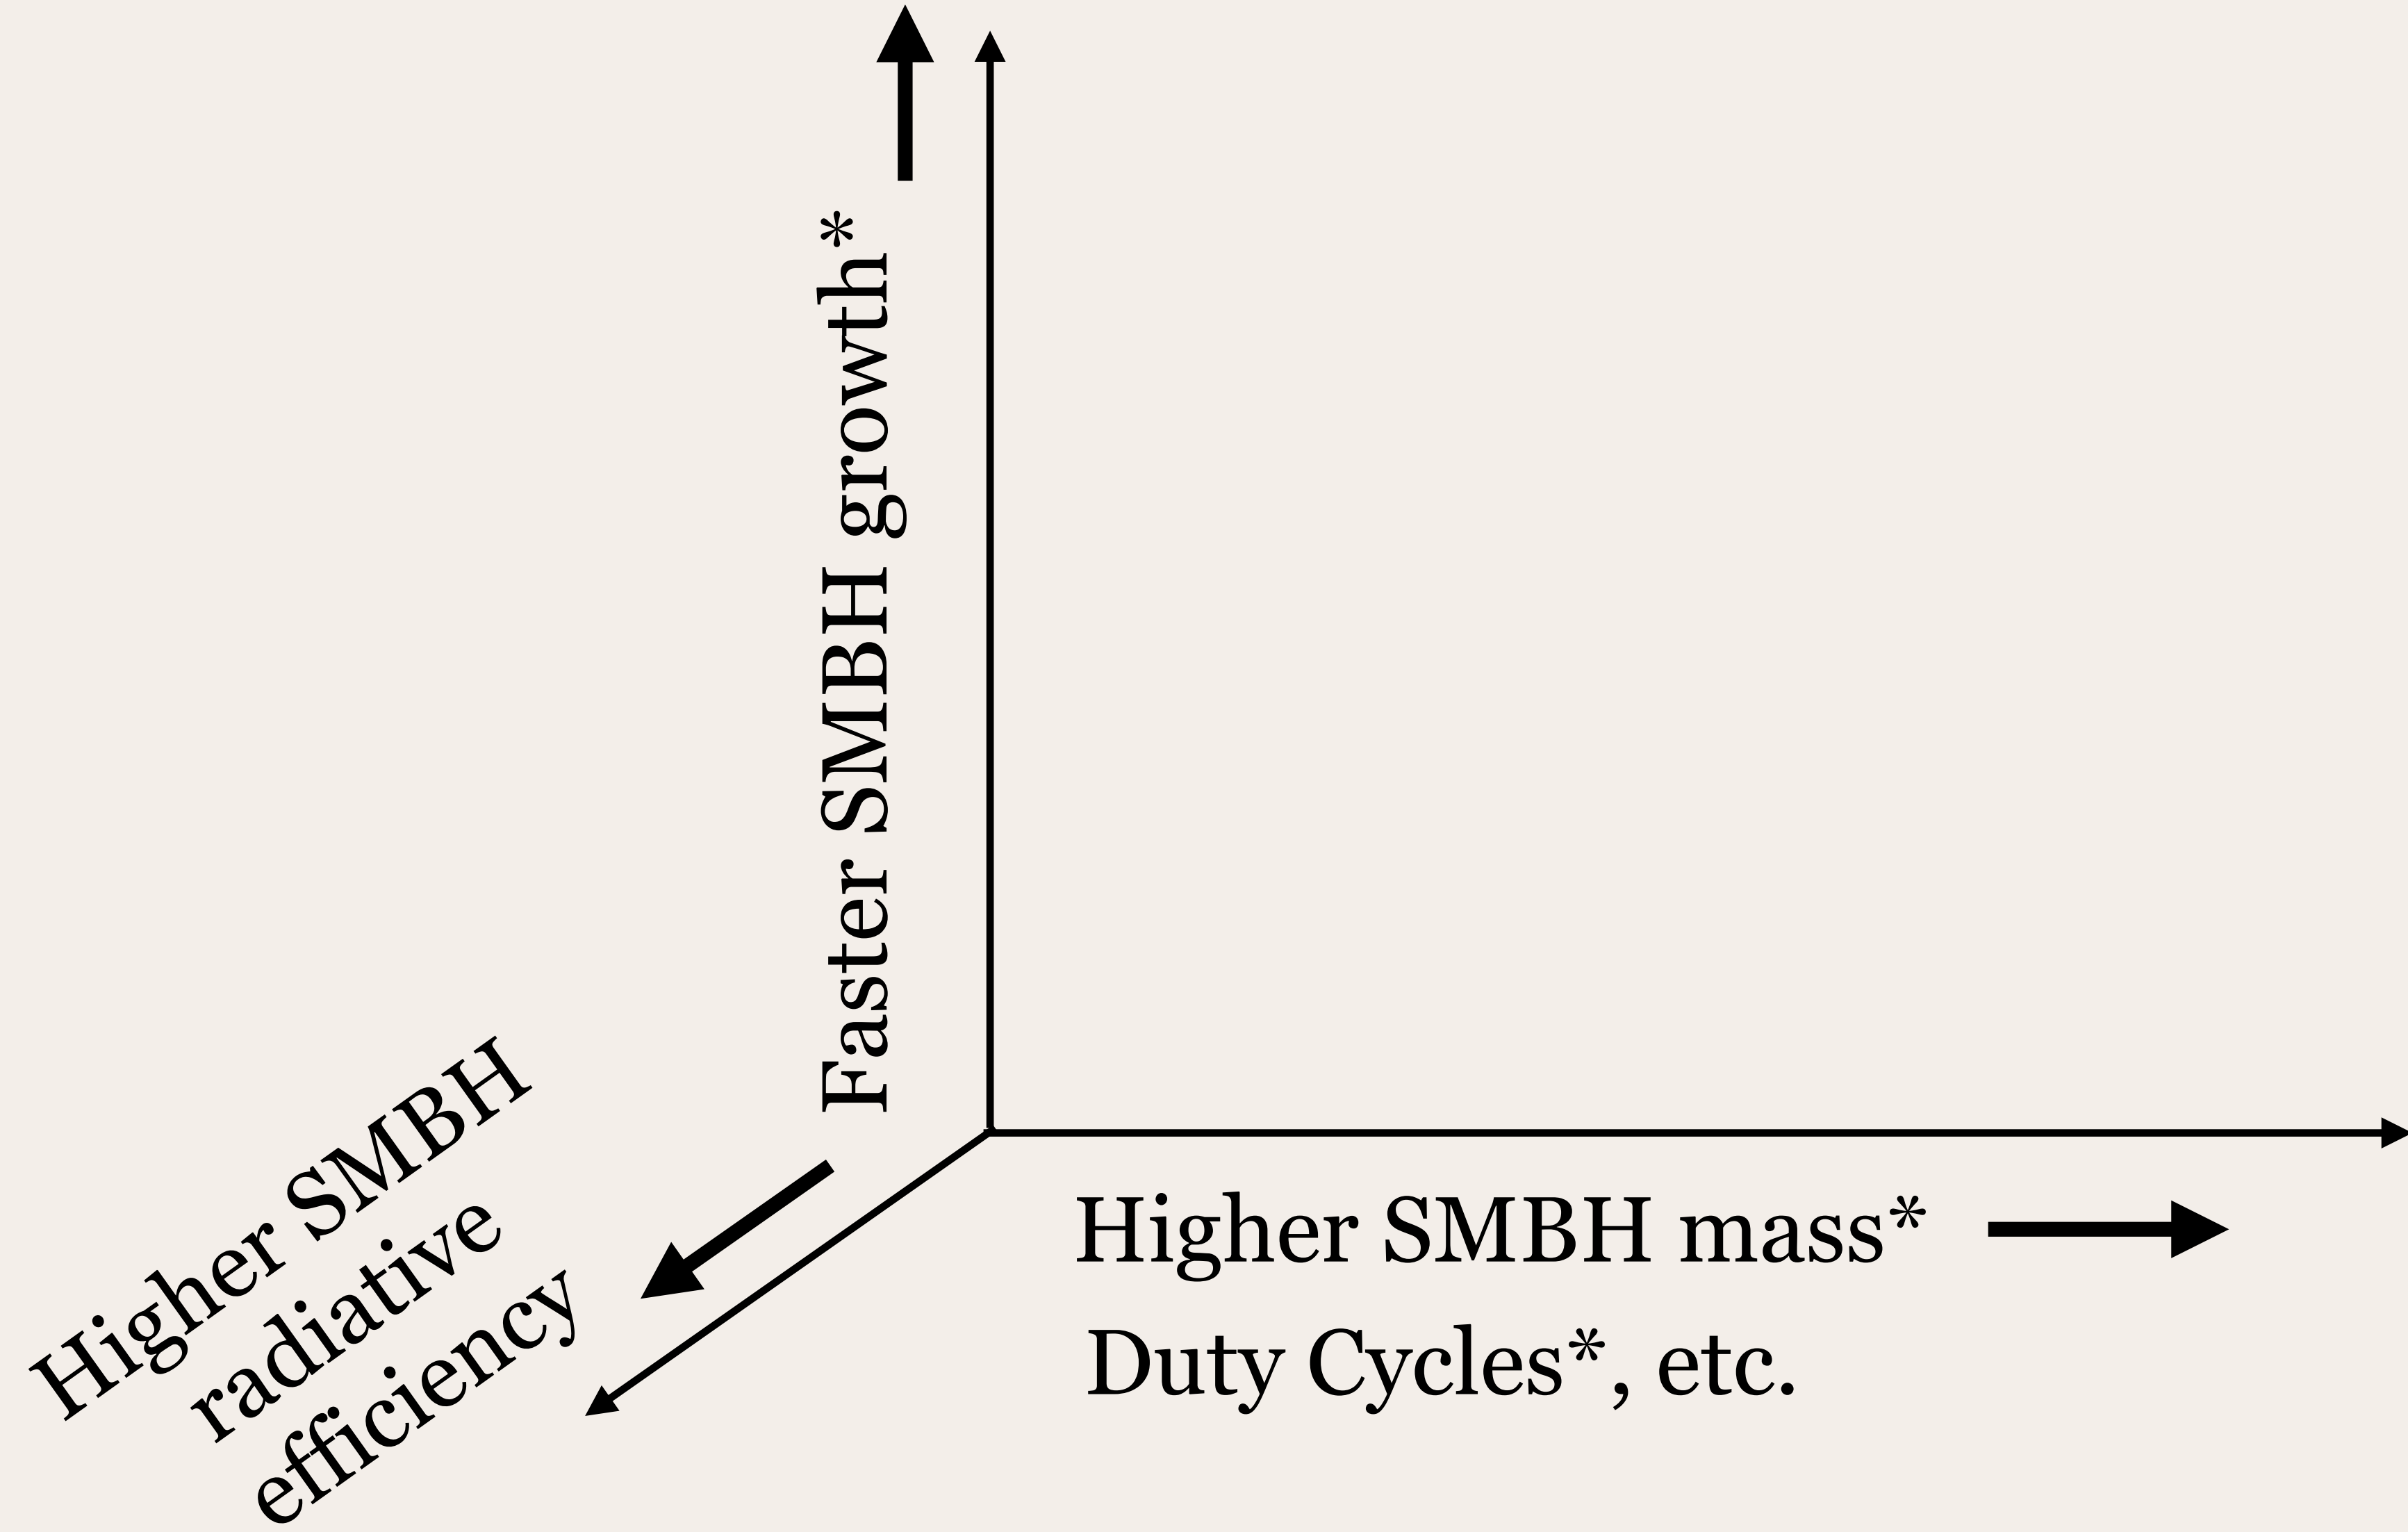

Empirical Models: Physical Latent Spaces

Empirical Models: More Data to Break Degeneracies

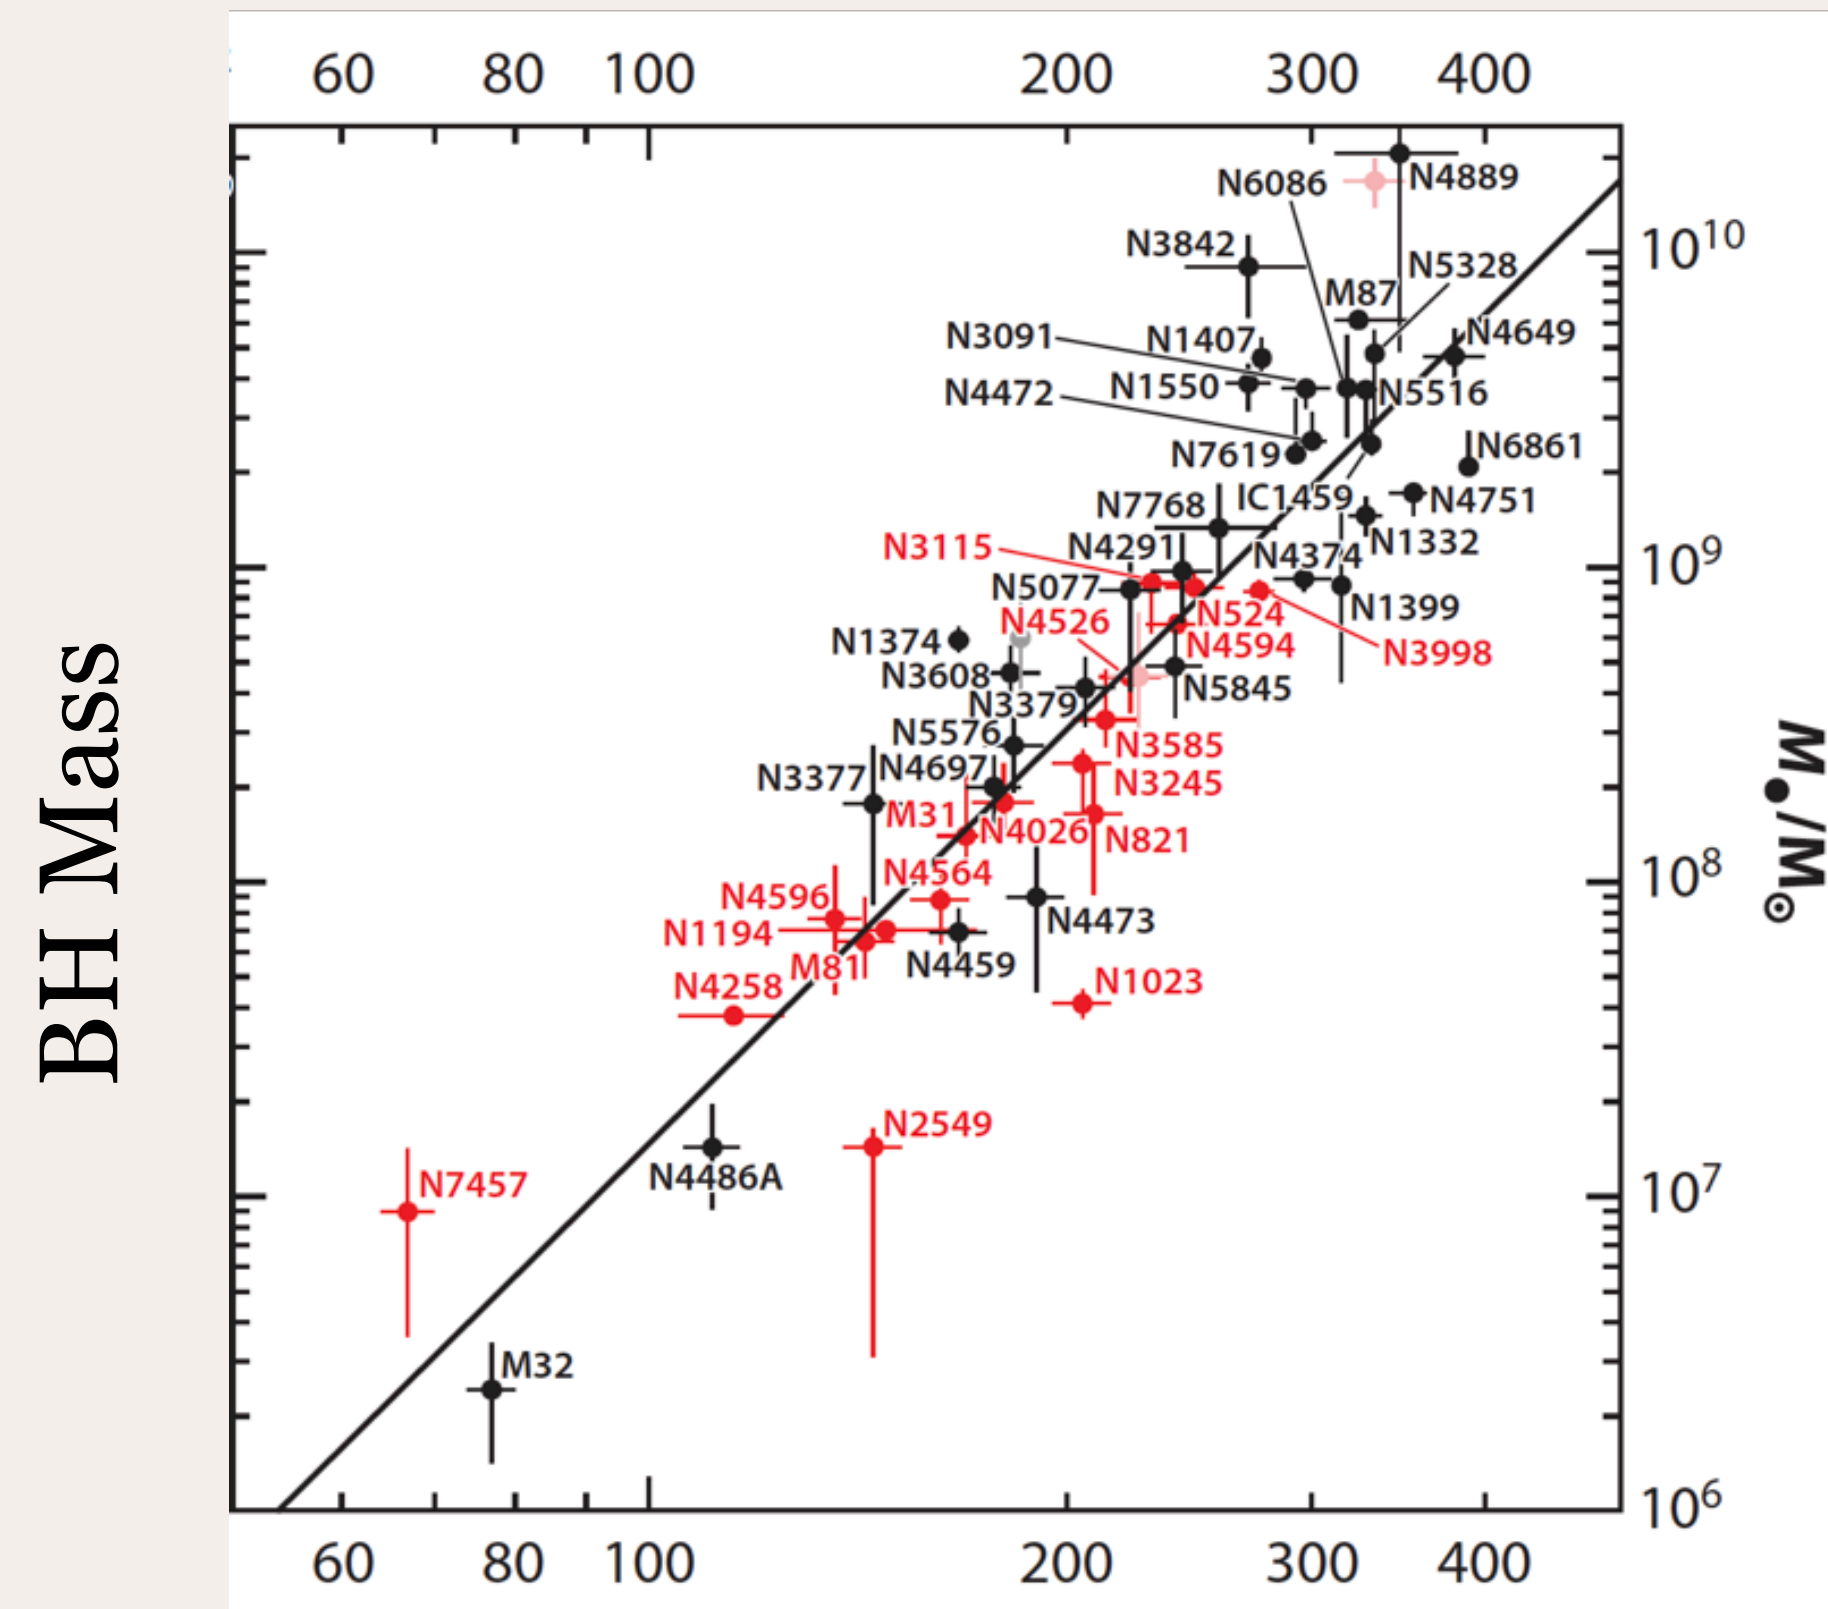

TRINITY: Latent Space For Galaxy—SMBH connection

*All as functions of galaxy mass

TRINITY: Why This Latent Space?

Local Universe: M- σ Relation

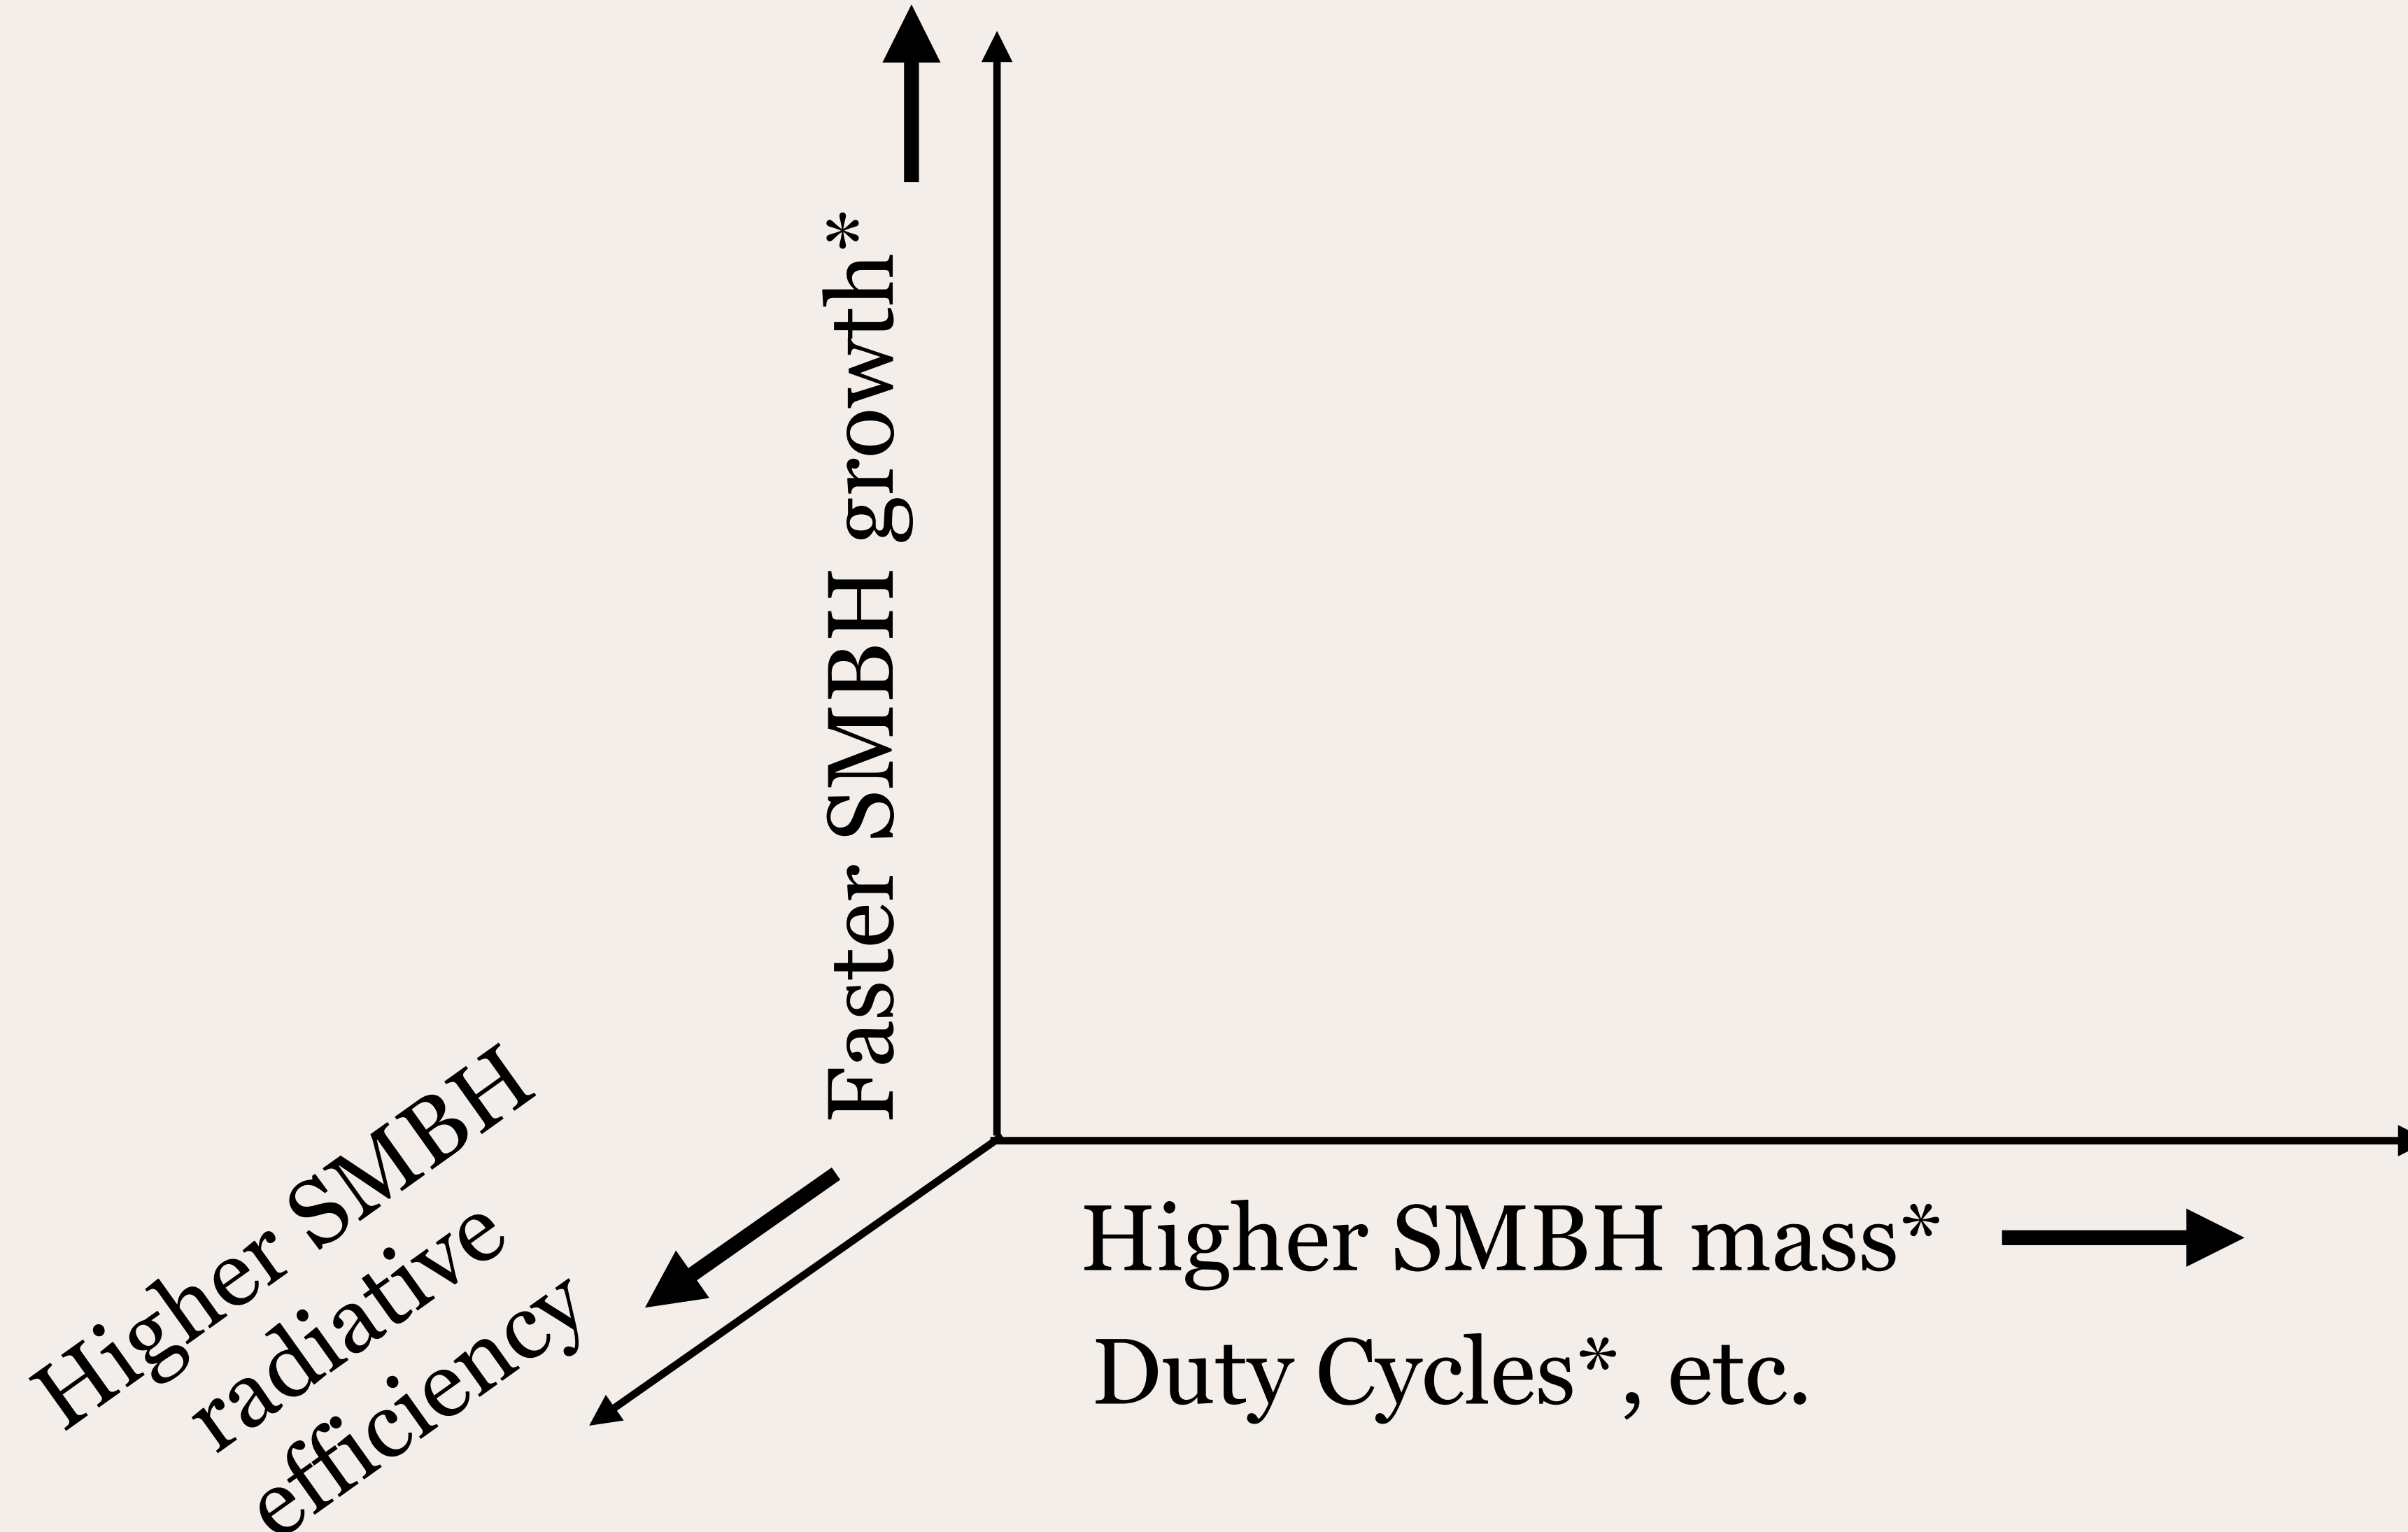

Velocity Dispersion

Kormendy & Ho 2013

TRINITY: Why This Latent Space?

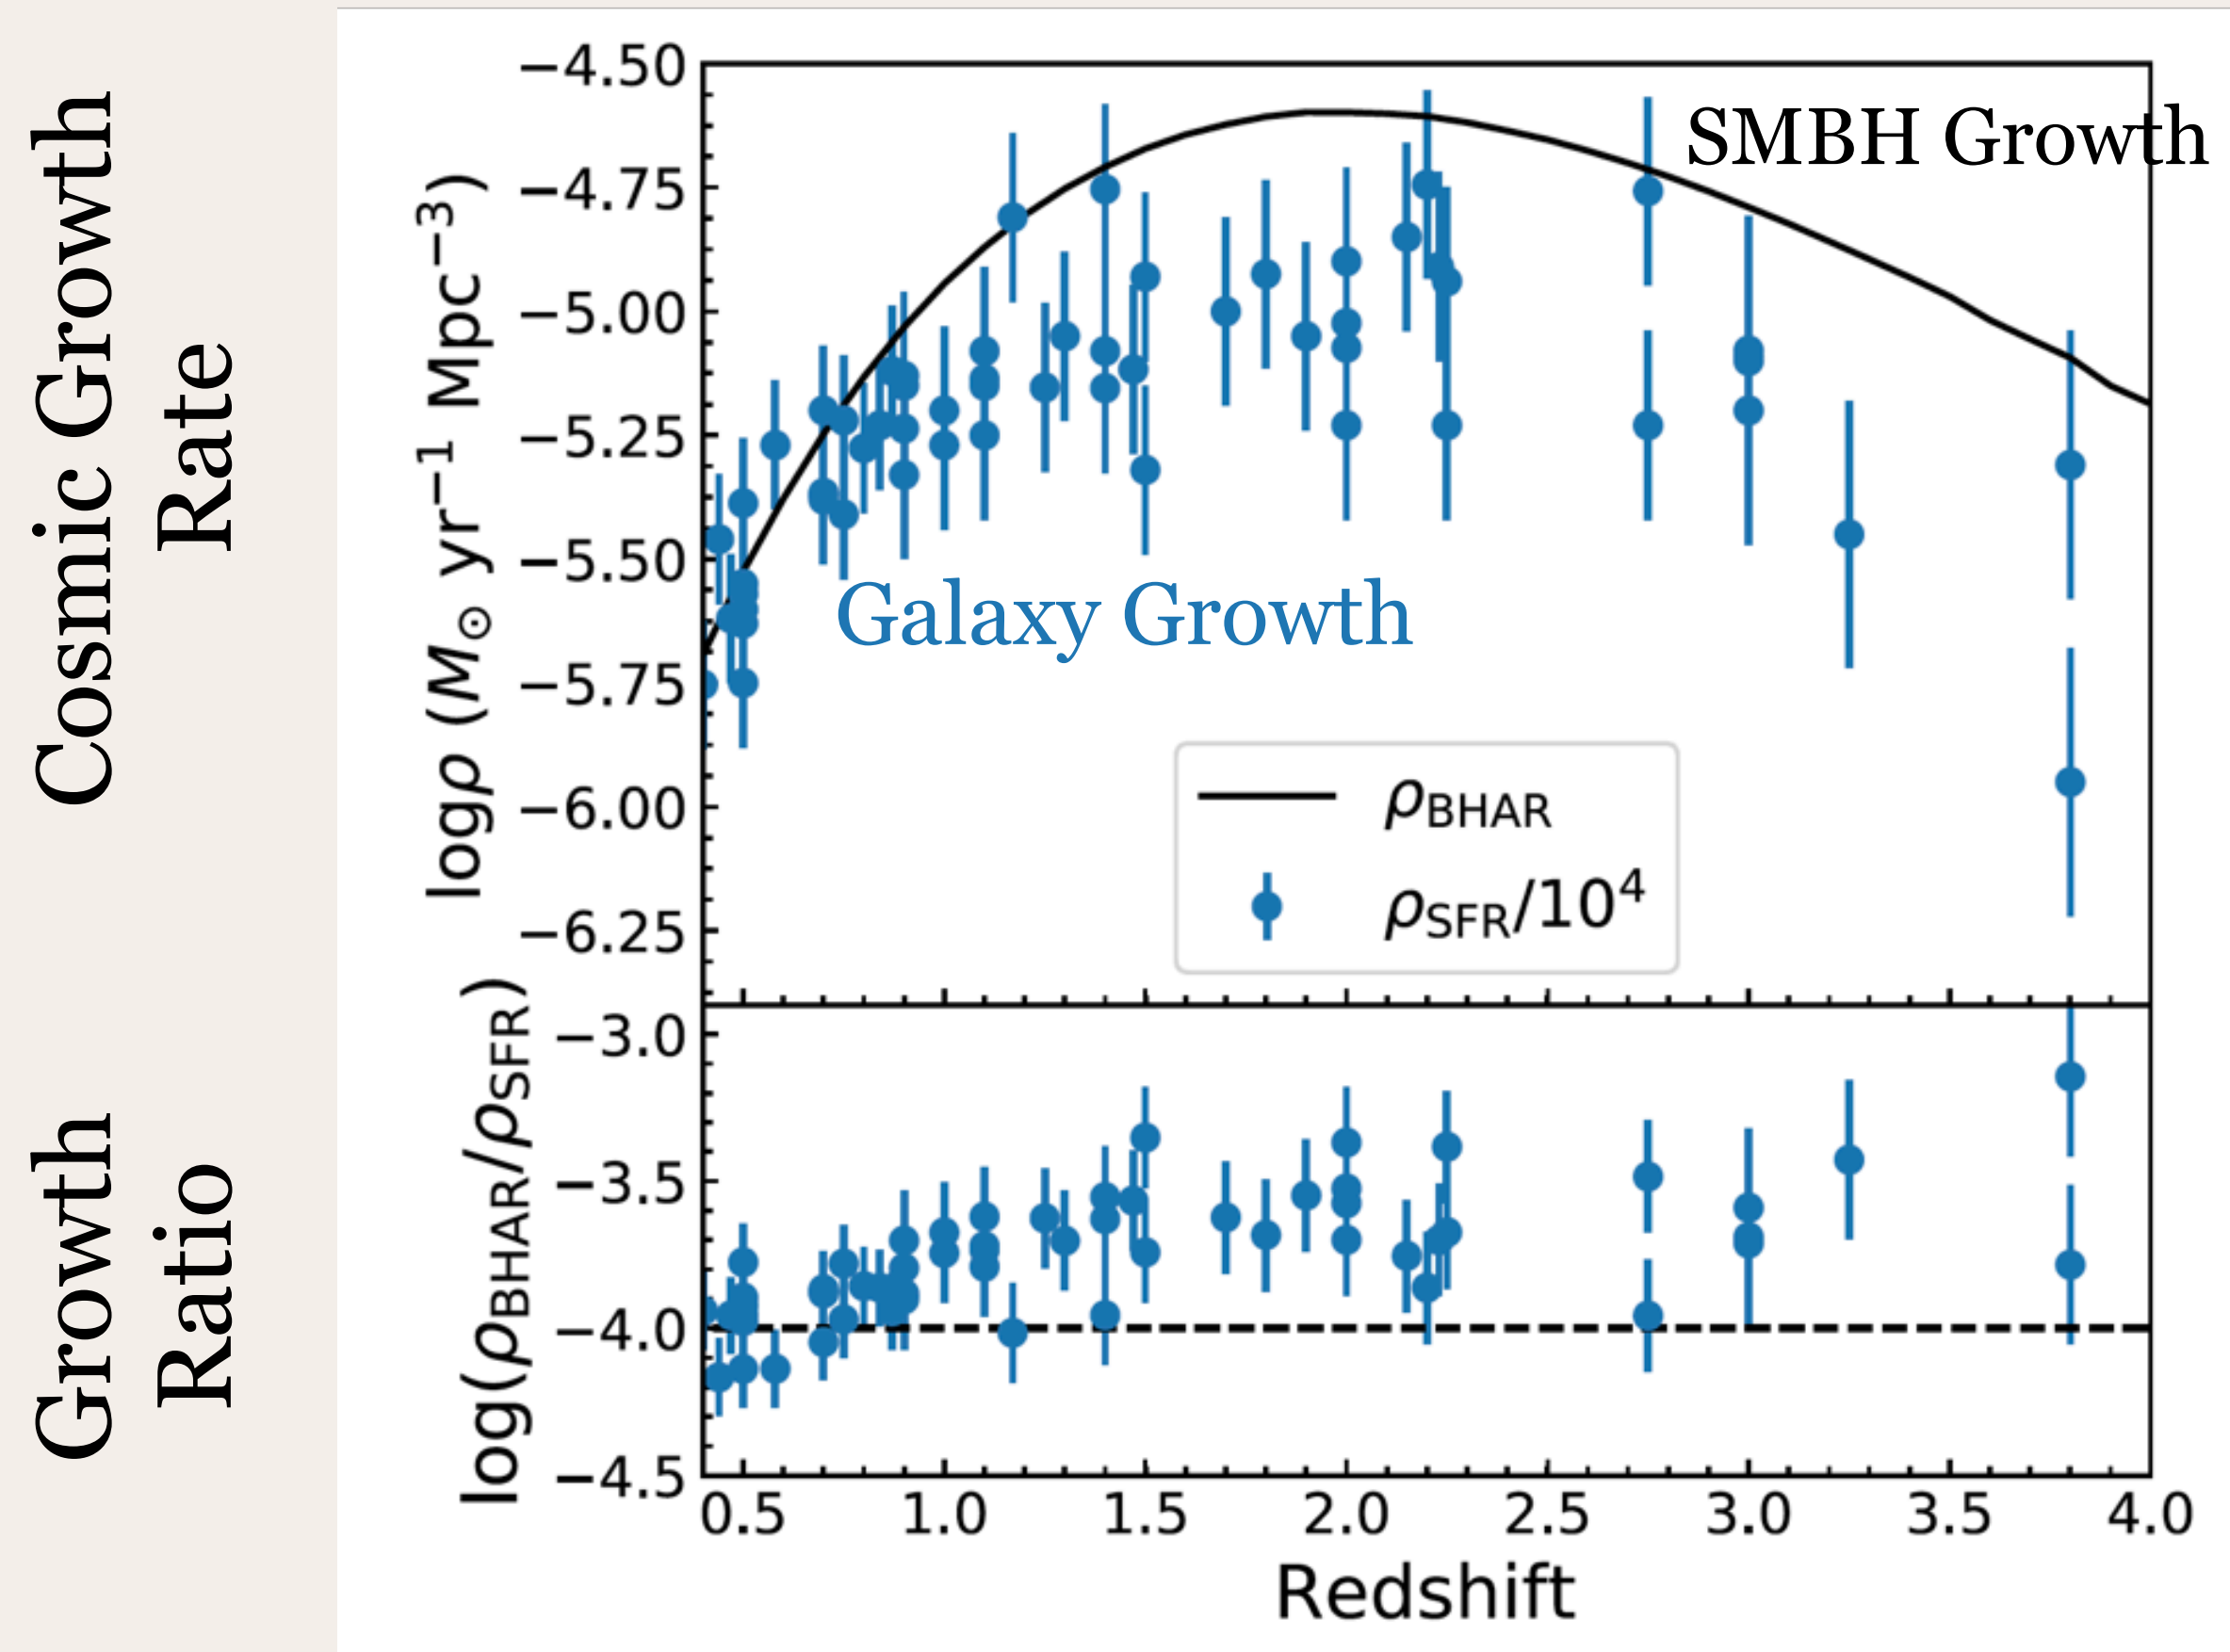

TRINITY: Latent Space For Galaxy—SMBH connection

*All as functions of galaxy mass

TRINITY: Why This Latent Space?

$z > 0$: *Cosmic* BHAR/SFR Ratio

Yang et al. (2017)

TRINITY: Why This Latent Space?

Mutch et al. (2013)

TRINITY: Why This Latent Space?

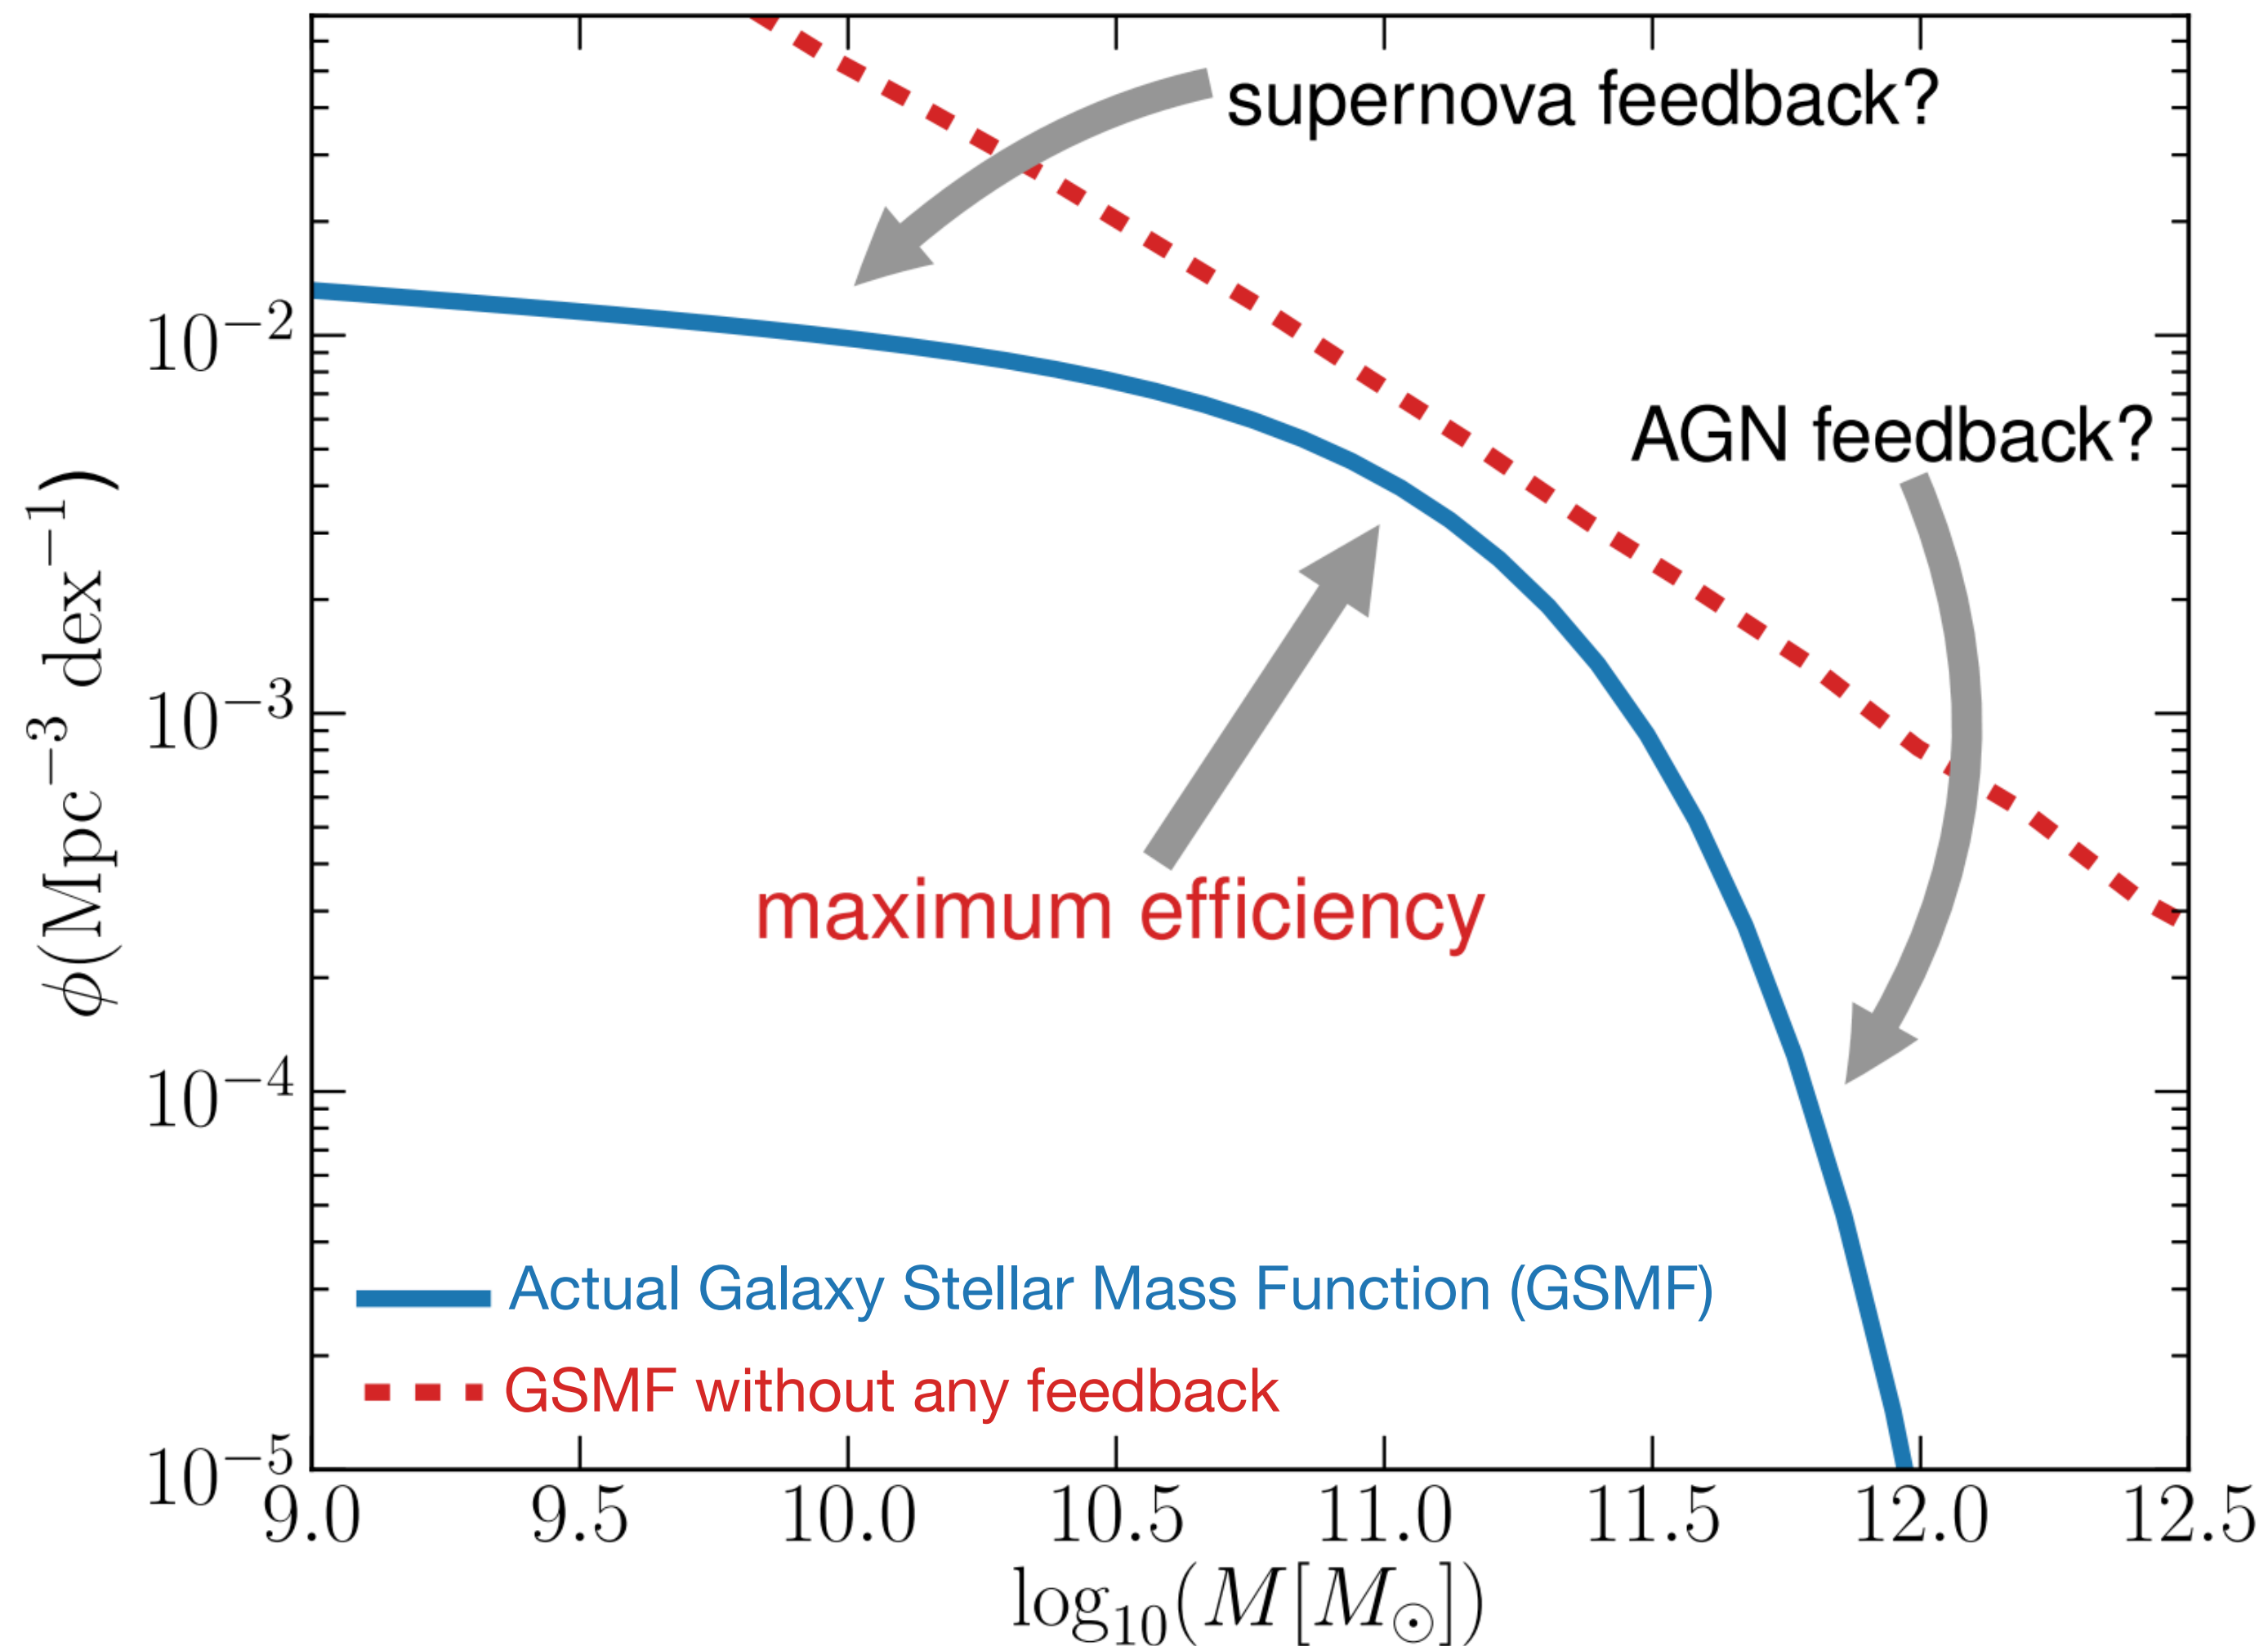

Mutch et al. (2013)

AGN Feedback Mode

$$\sim \eta_{\text{Edd}} \sim \frac{\dot{M}_{\text{BH}}}{M_{\text{BH}}}$$

TRINITY: Why This Latent Space?

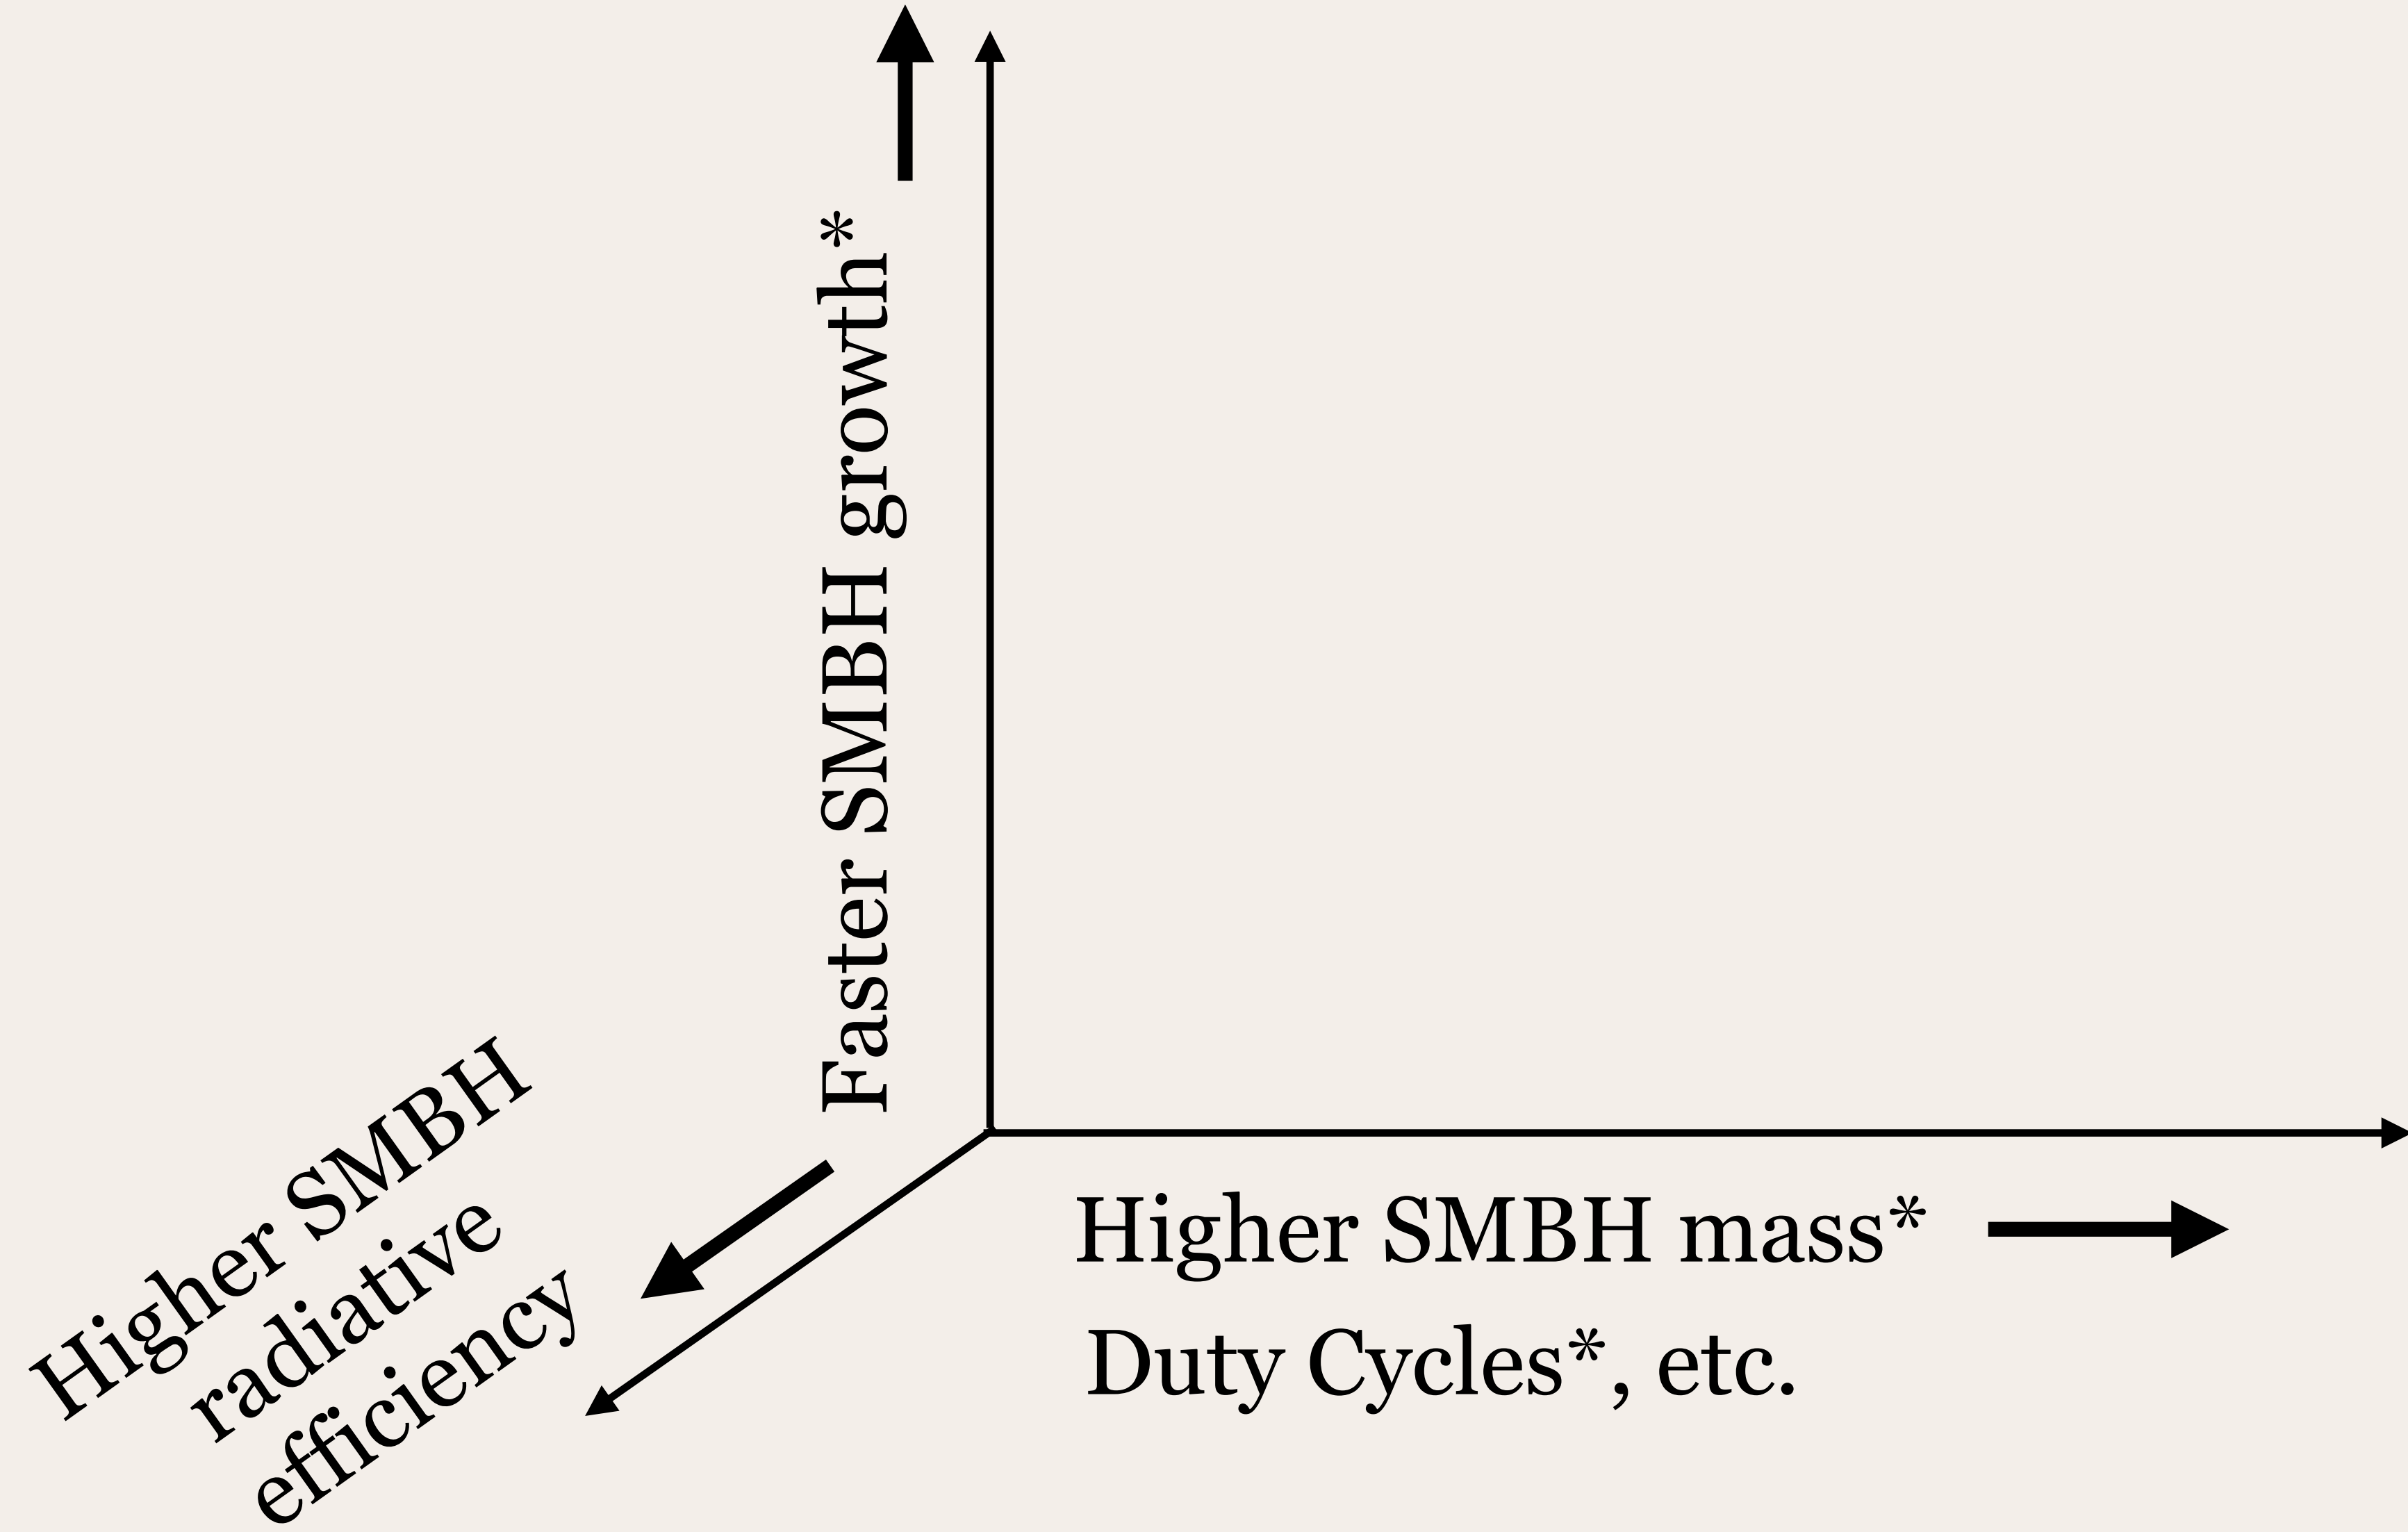

Mutch et al. (2013)

AGN Feedback Mode

$$\sim \eta_{\text{Edd}} \sim \frac{\dot{M}_{\text{BH}}}{M_{\text{BH}}}$$

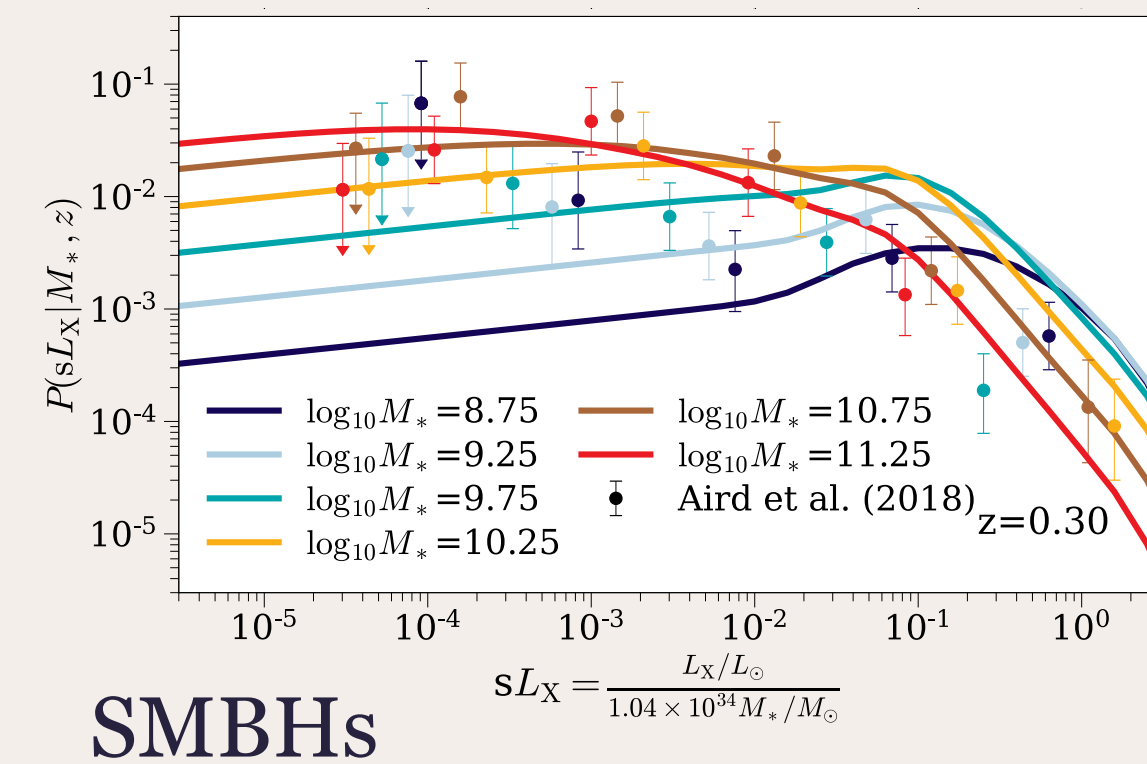

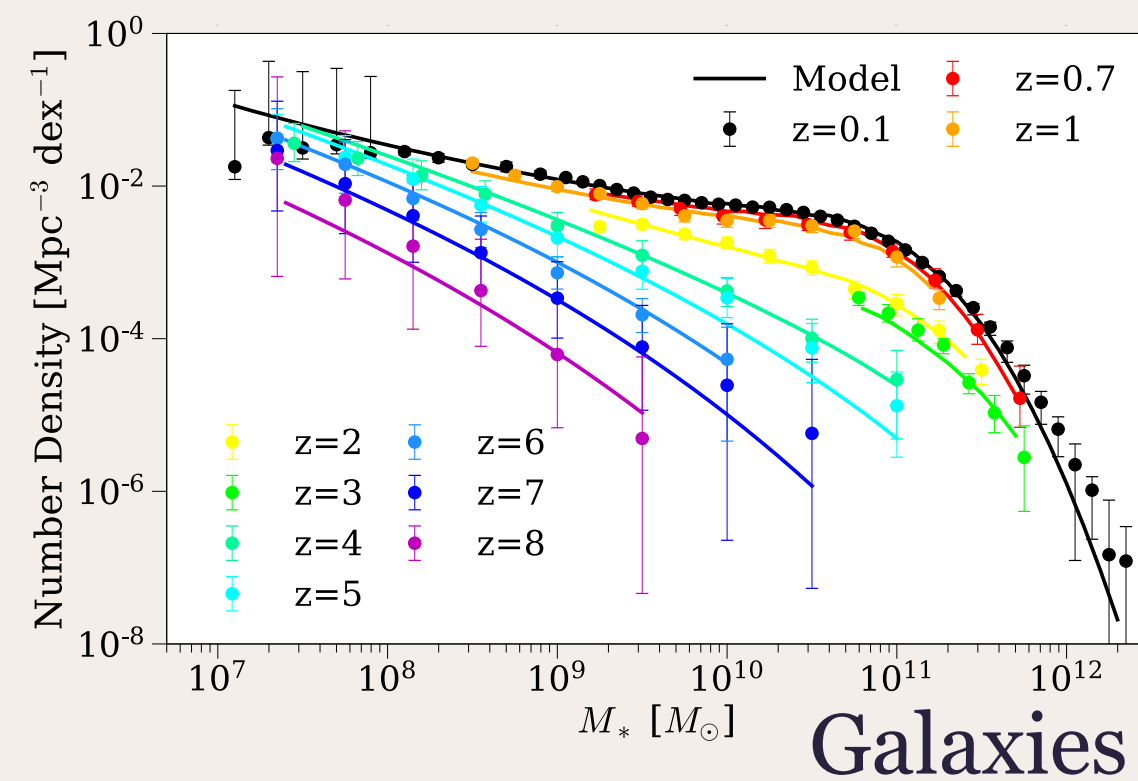

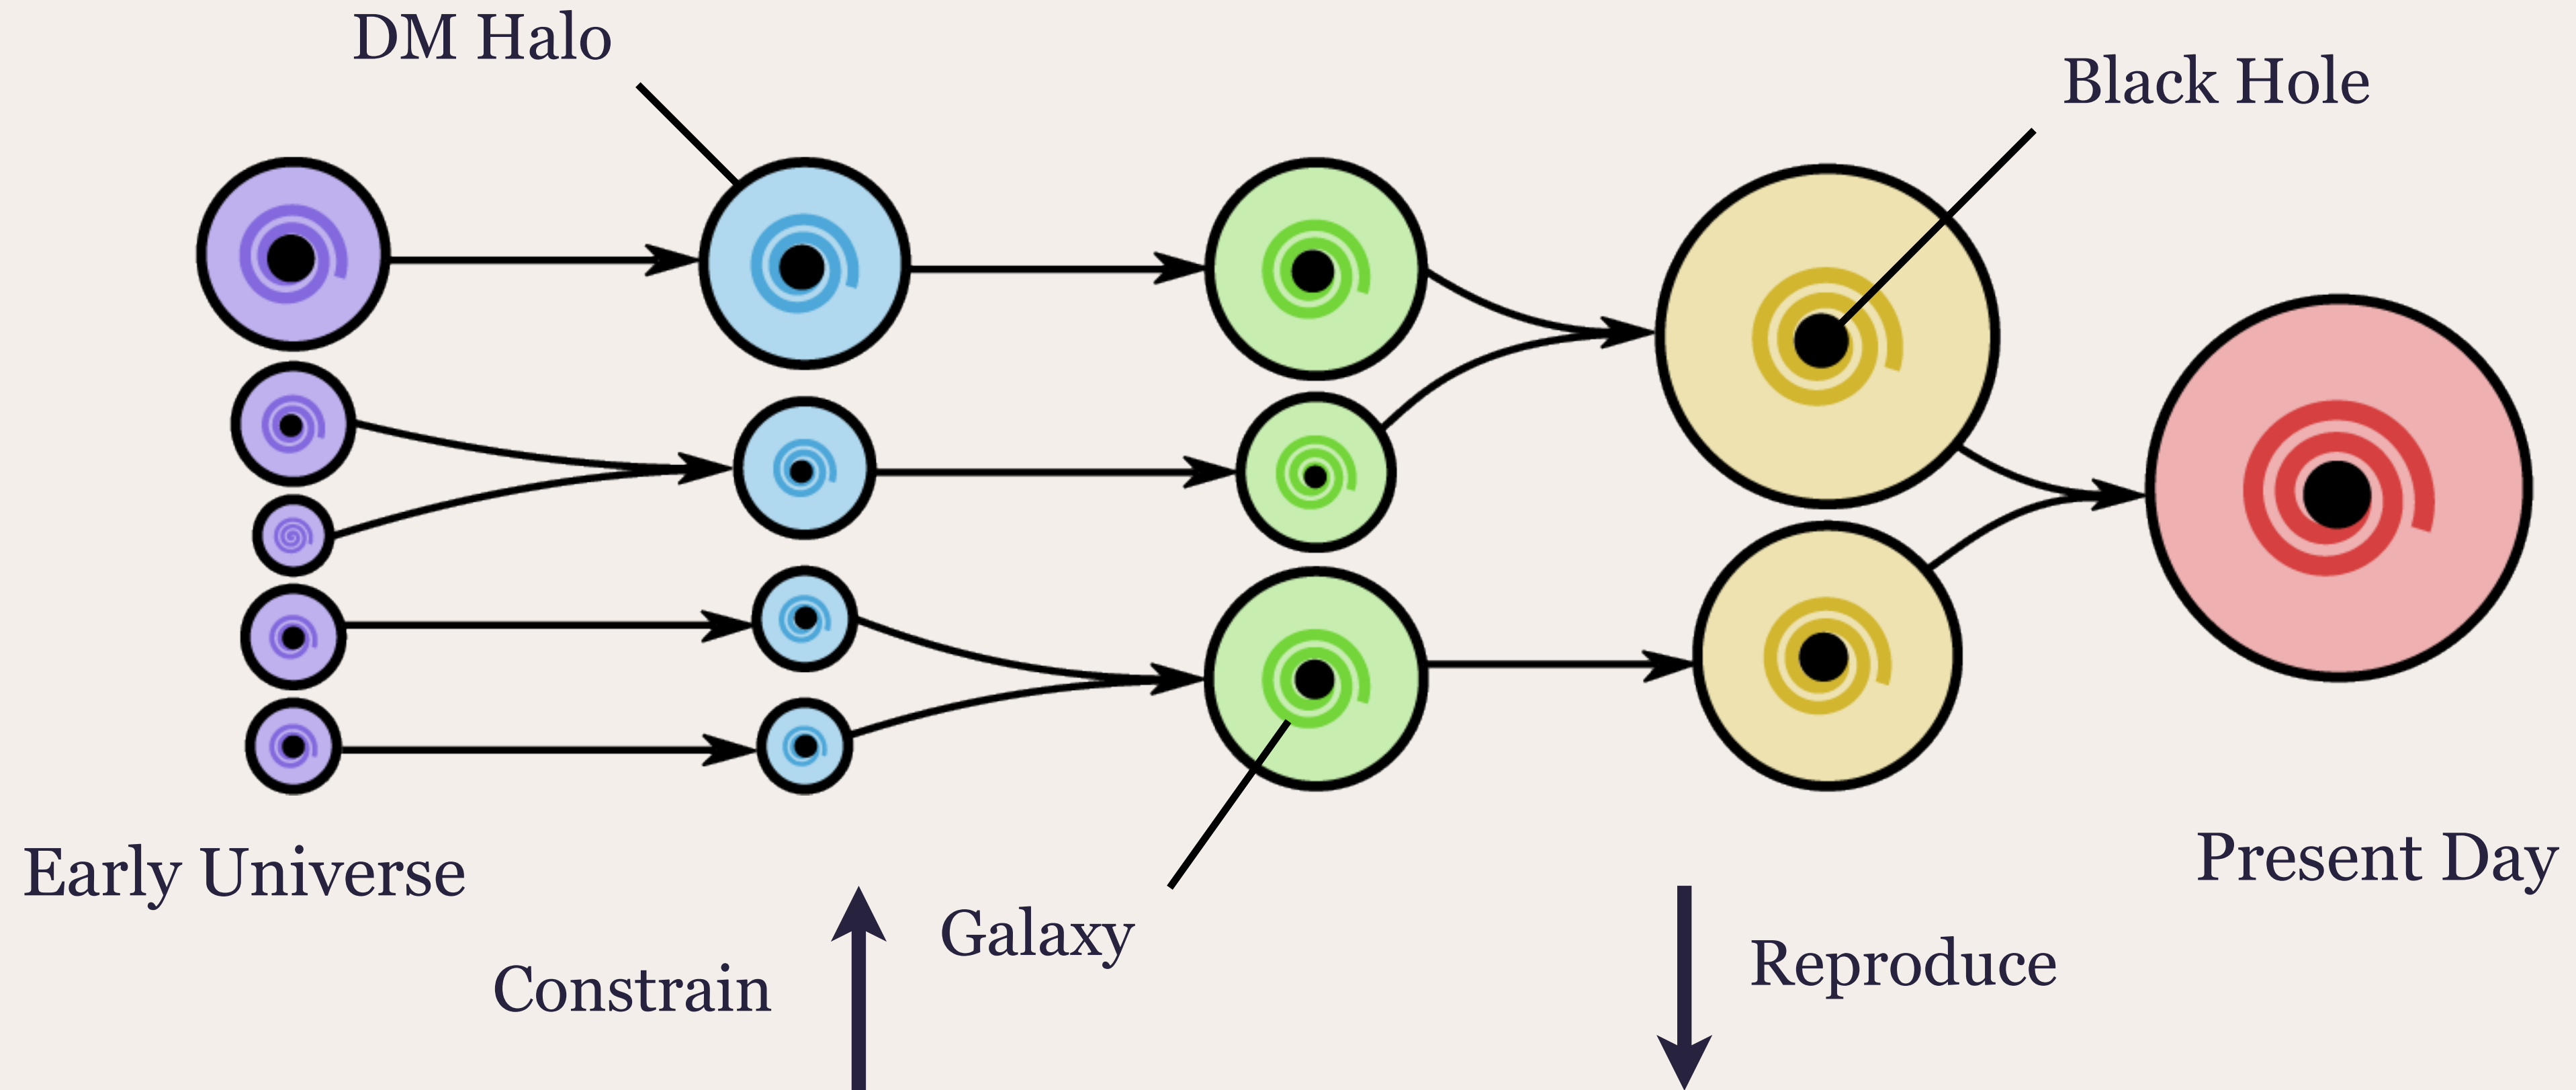

Low η_{Edd} \rightarrow More kinetic feedback

TRINITY: Latent Space For Galaxy—SMBH connection

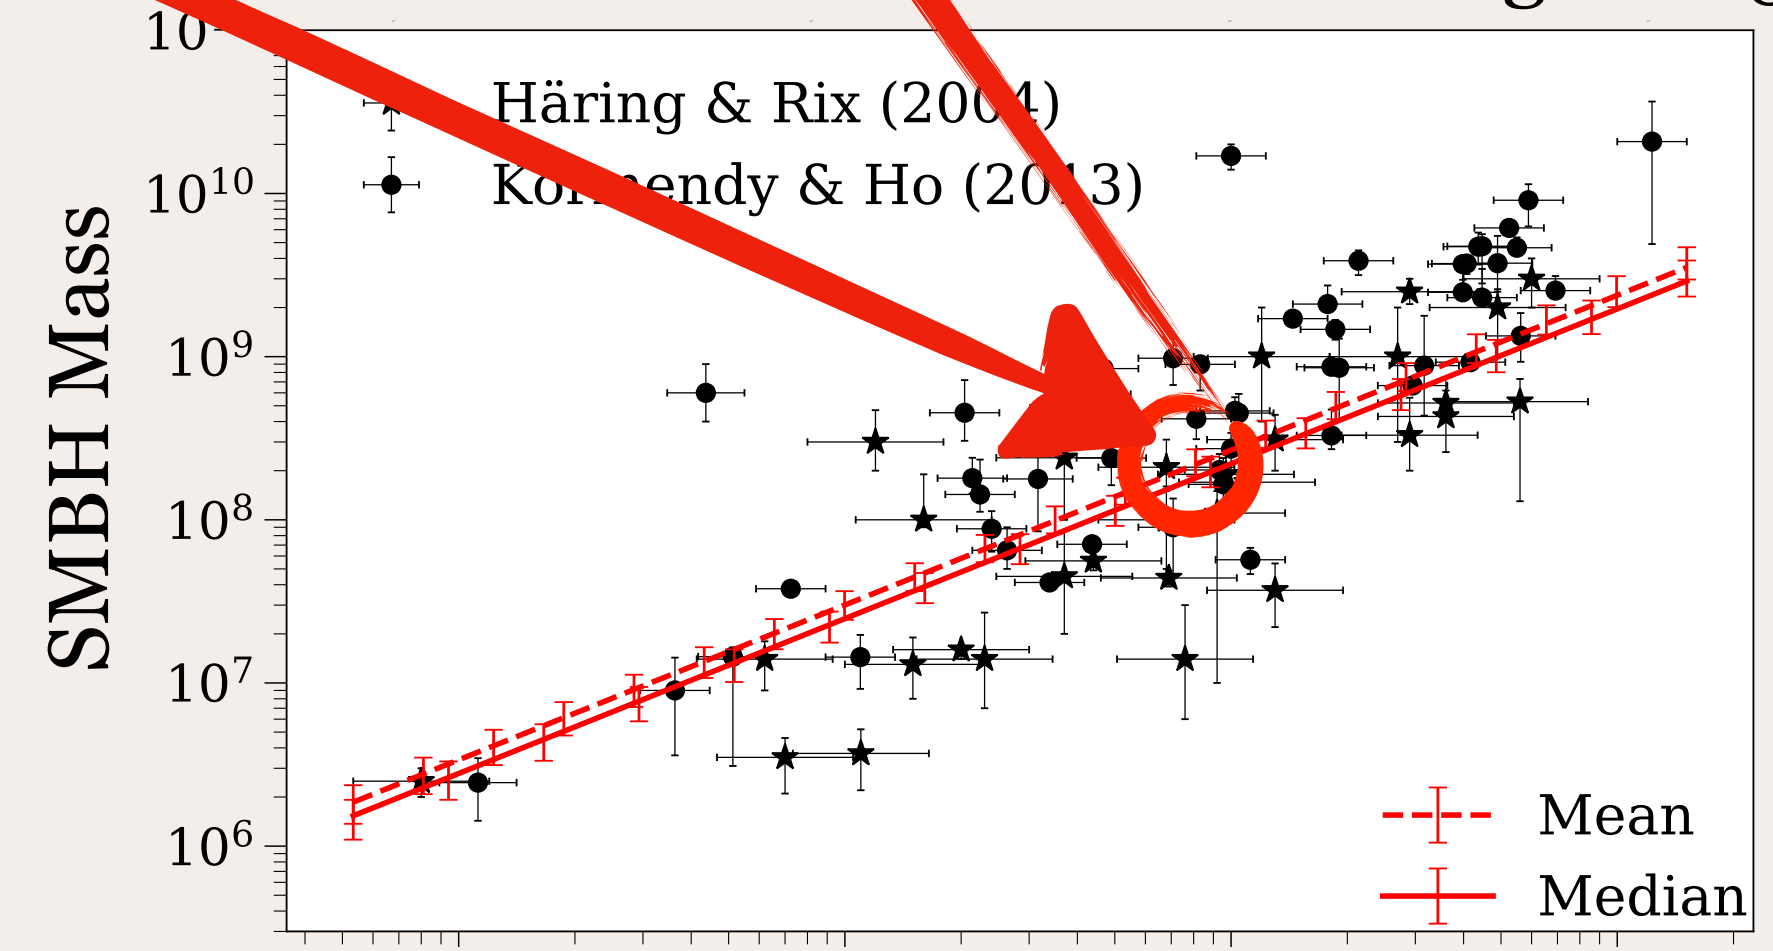

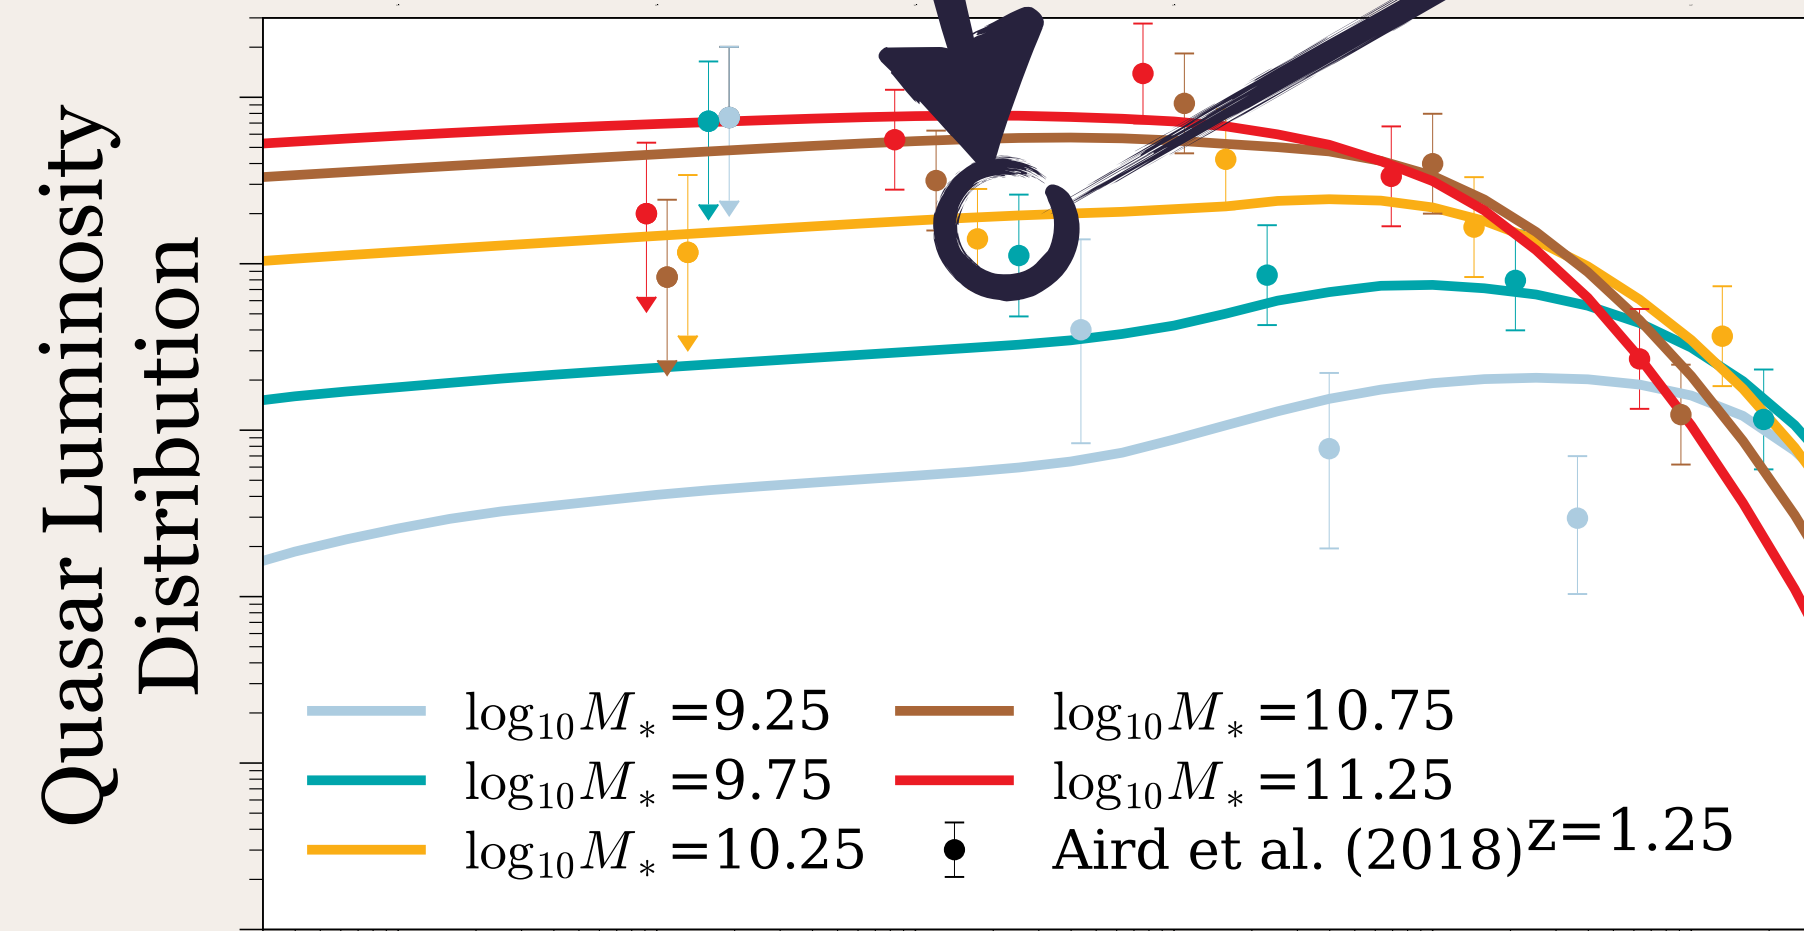

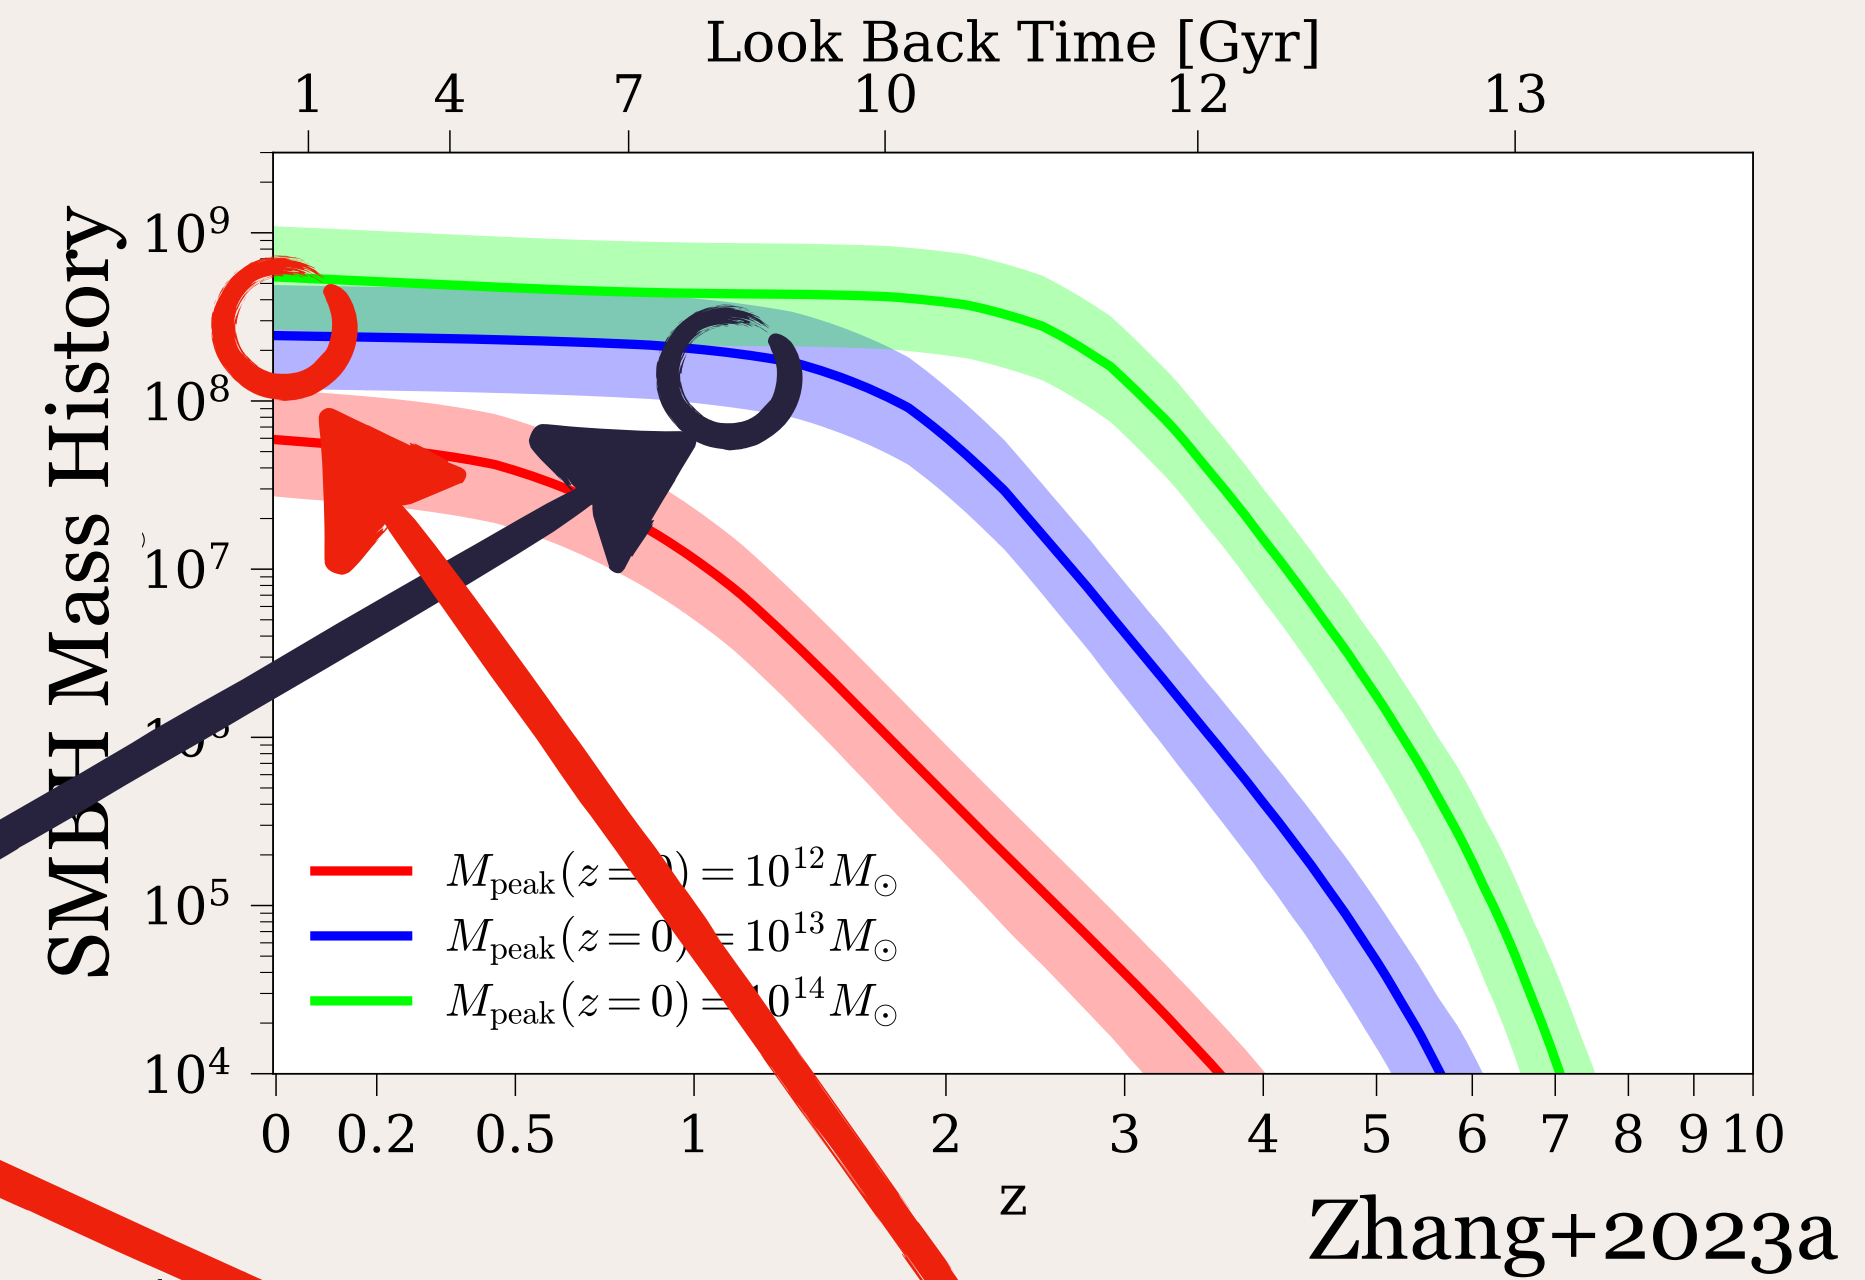

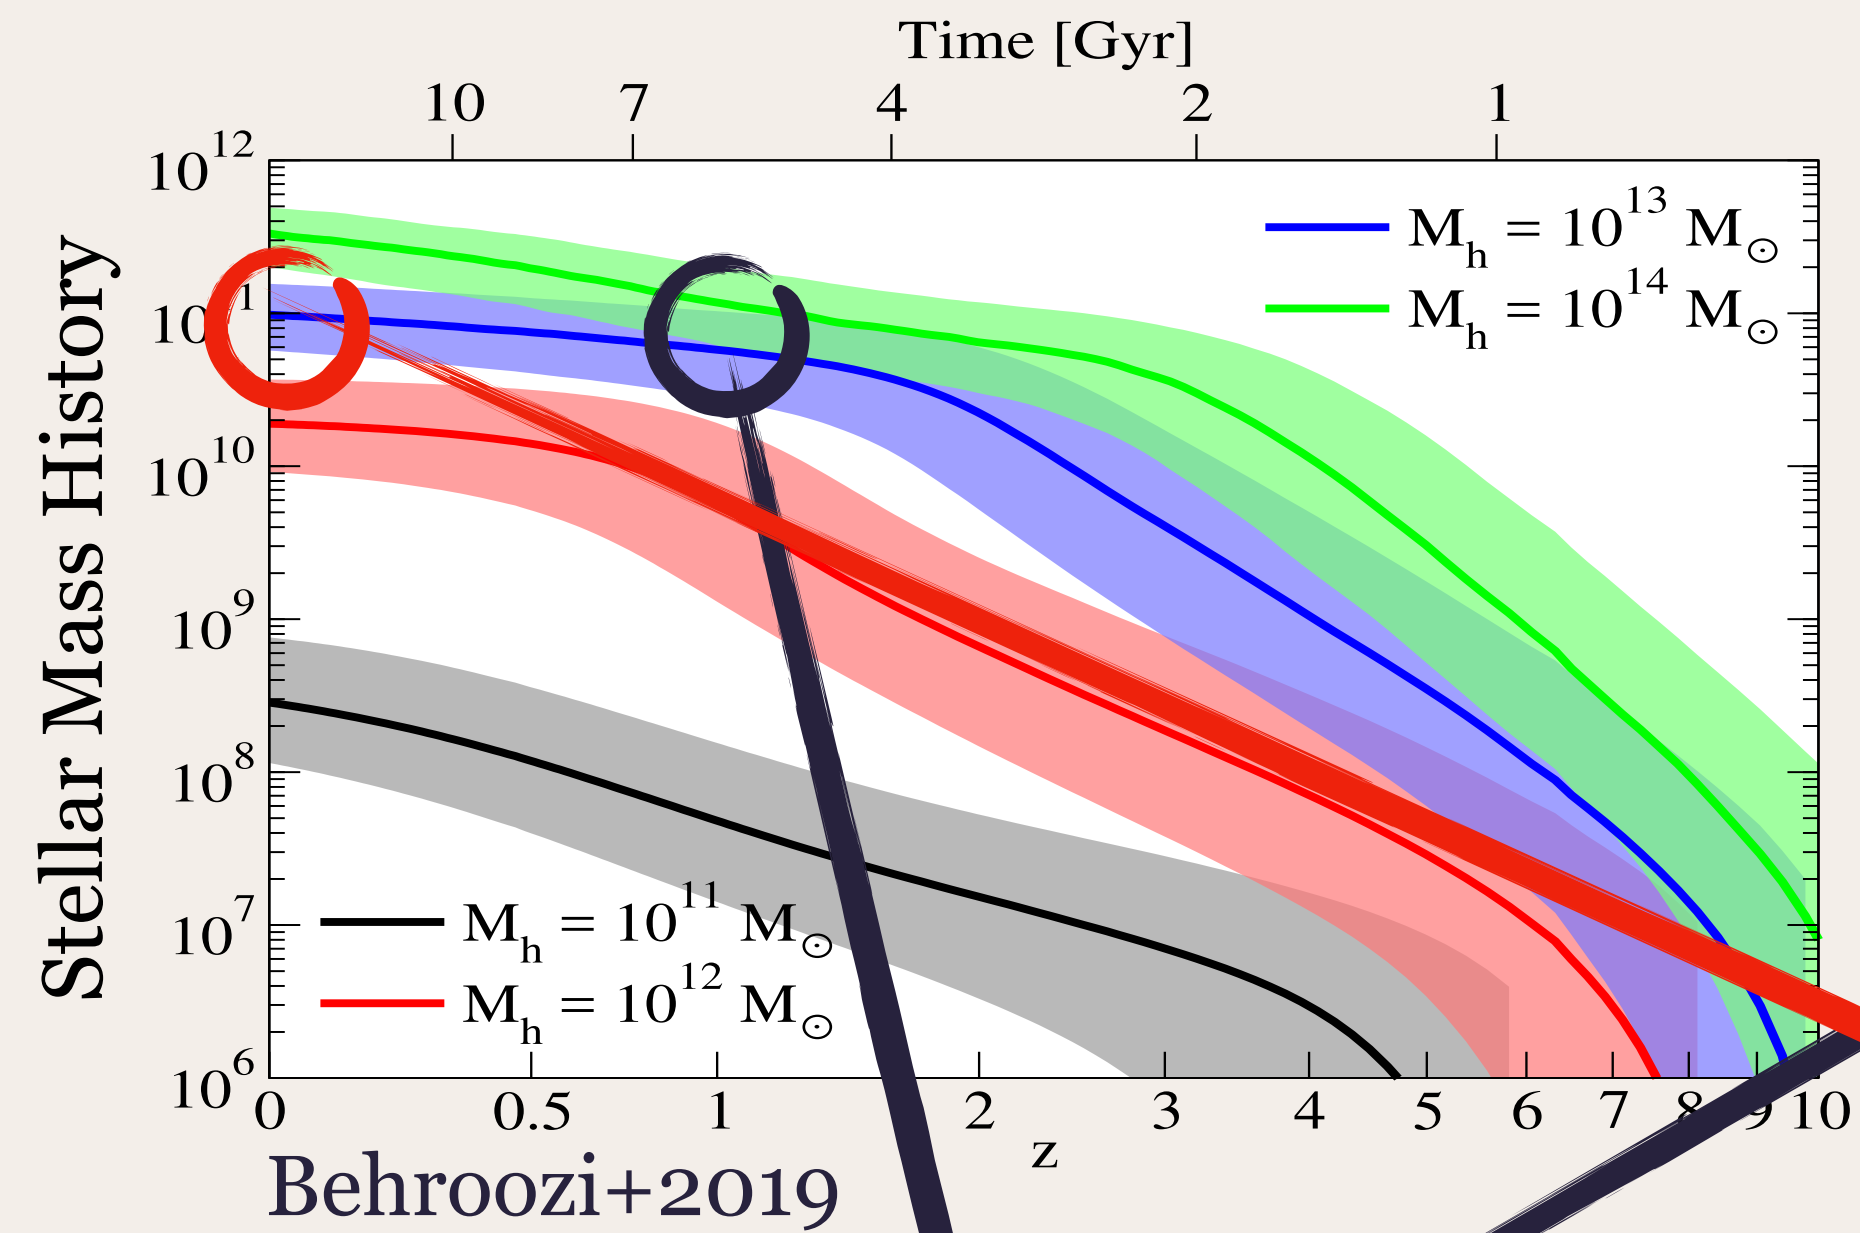

*All as functions of galaxy mass

TRINITY: Breaking Degeneracies

TRINITY: Breaking Degeneracies

z>0 Quasar Luminosity

z=0 Galaxy Bulge Mass

*These are only a small subset of our data constraints

TRINITY: Data Constraints

Stellar Mass Functions

Specific Star Formation Rates

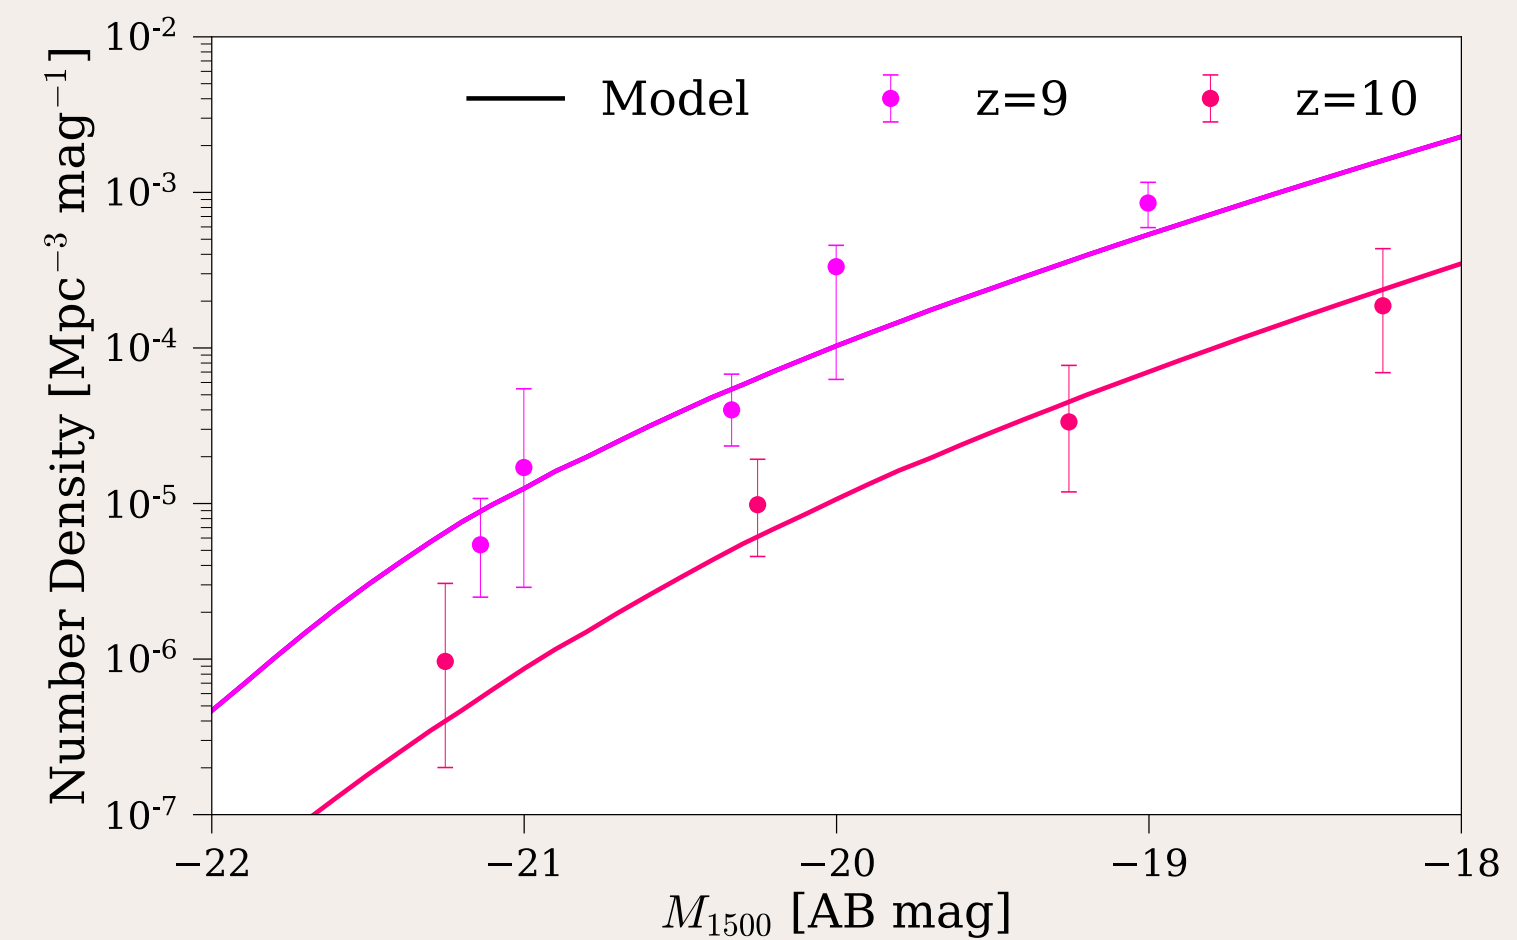

Cosmic Star Formation Rates

Quenched Fractions

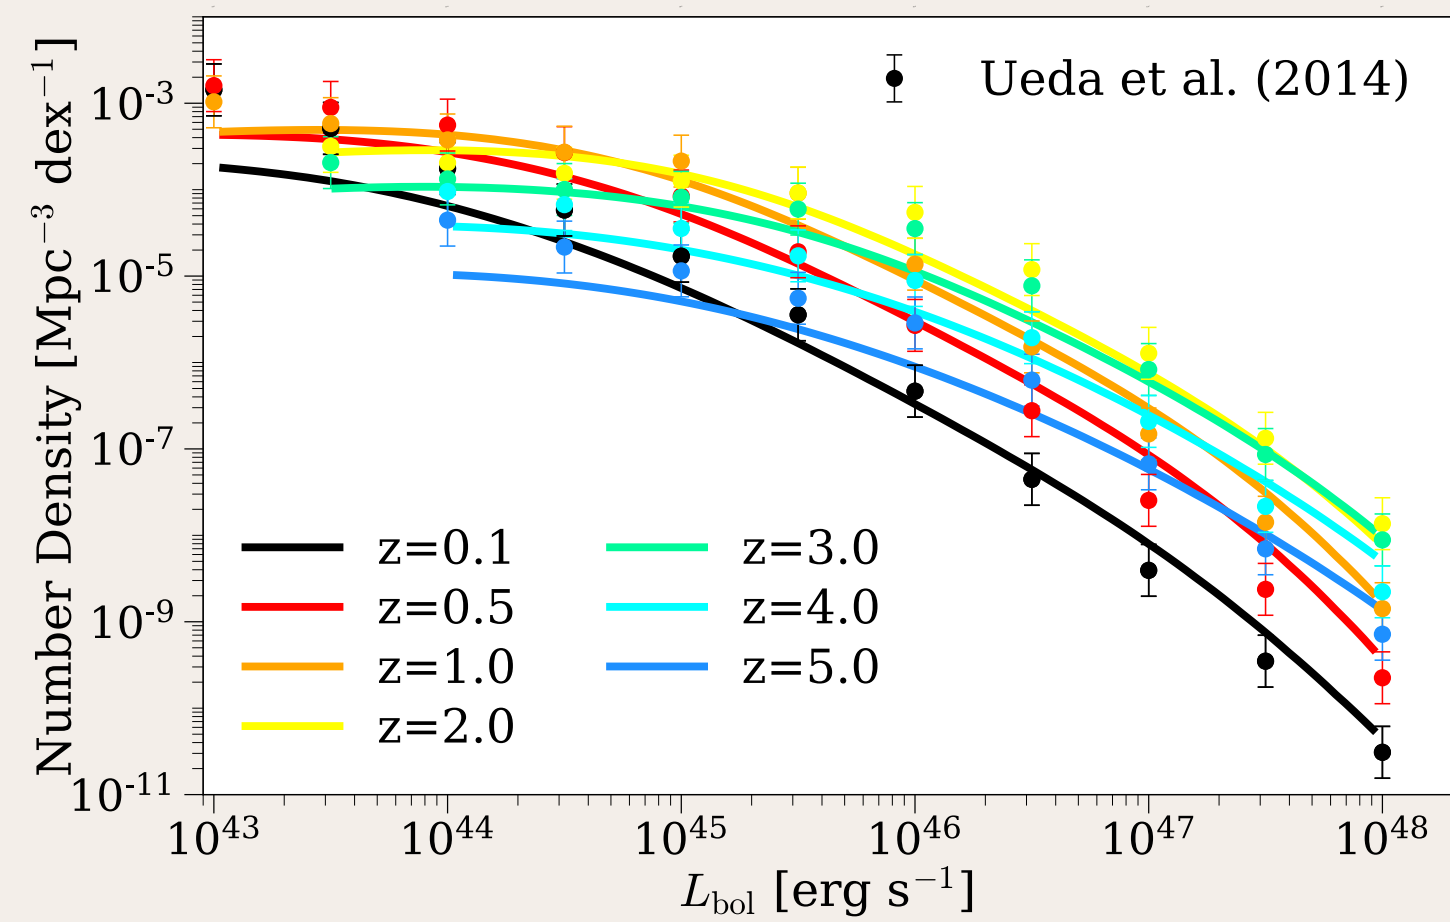

UV Luminosity Functions

TRINITY: Data Constraints

Quasar Probability Distribution Functions ($0 < z < 2.5$)

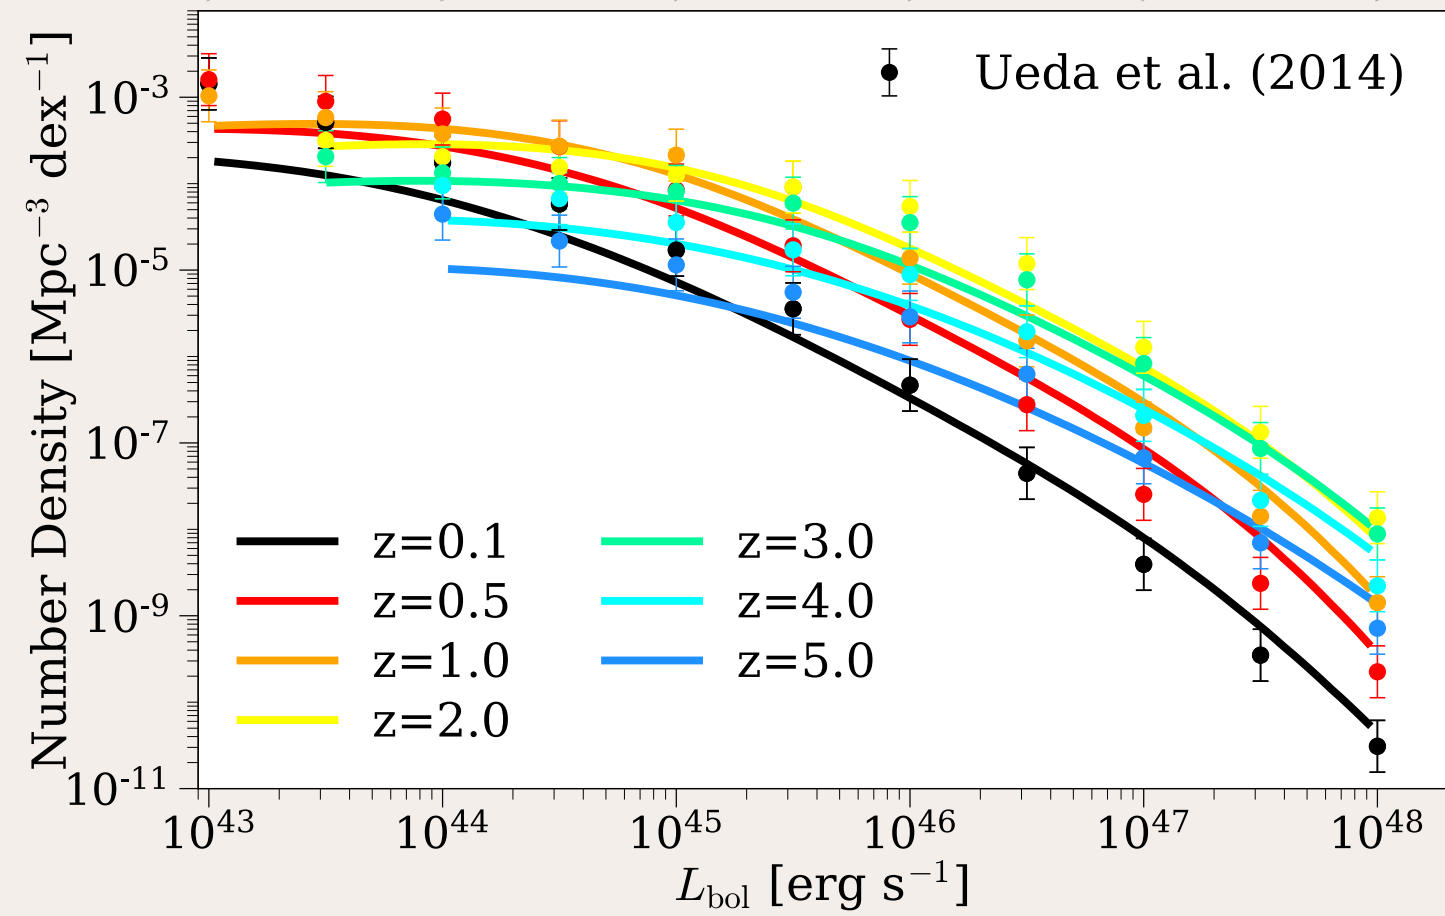

Quasar Luminosity Functions

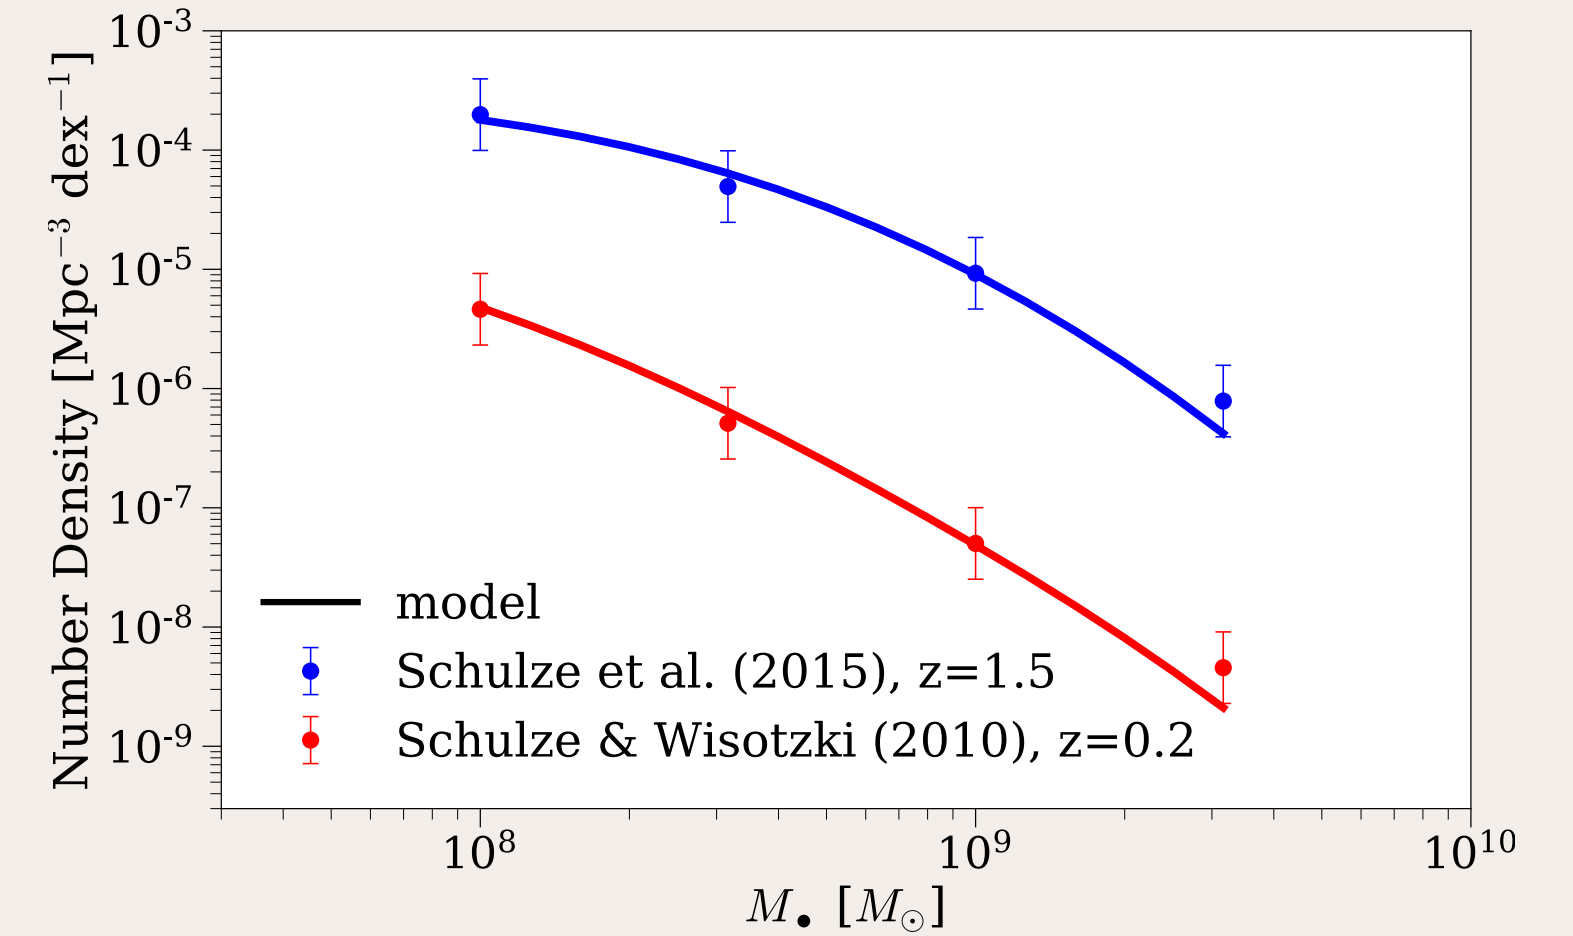

TRINITY: Data Constraints

Quasar Probability Distribution Functions ($0 < z < 2.5$)

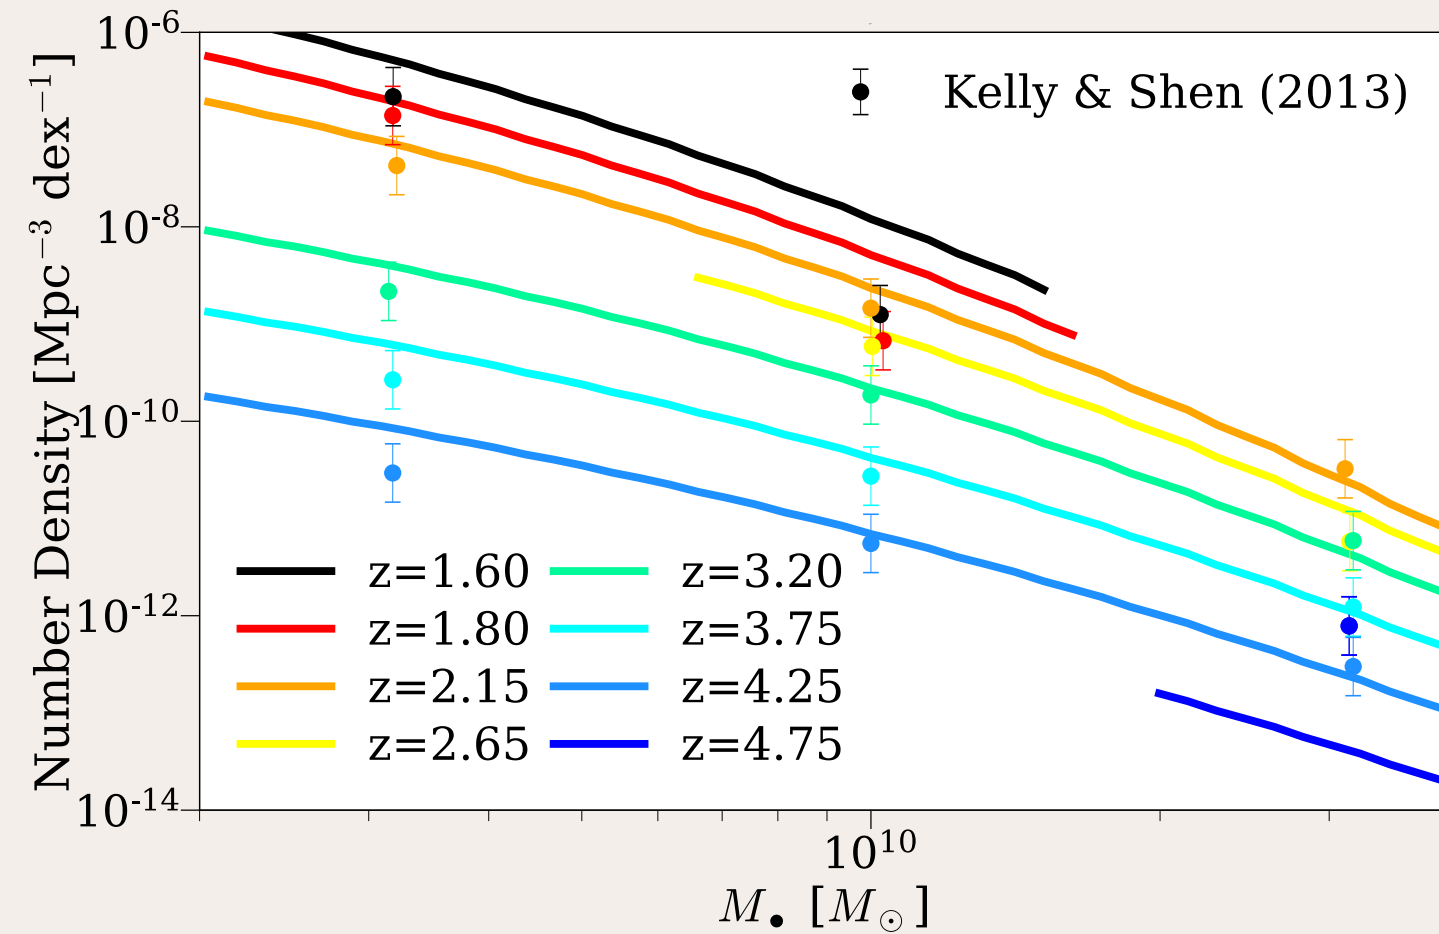

Quasar Luminosity Functions

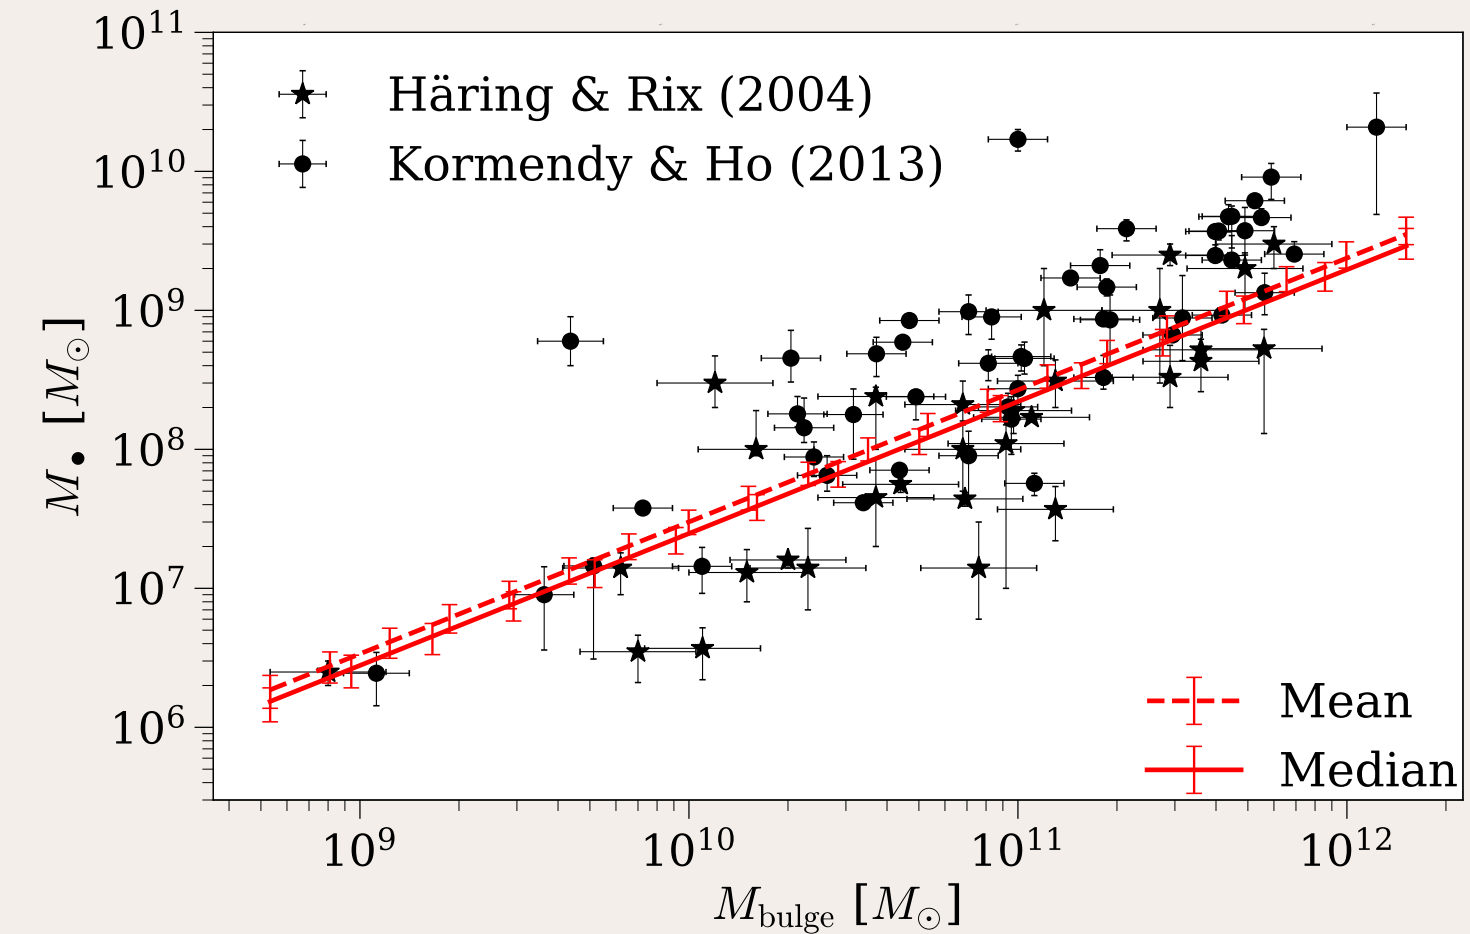

Active Black Hole Mass Functions

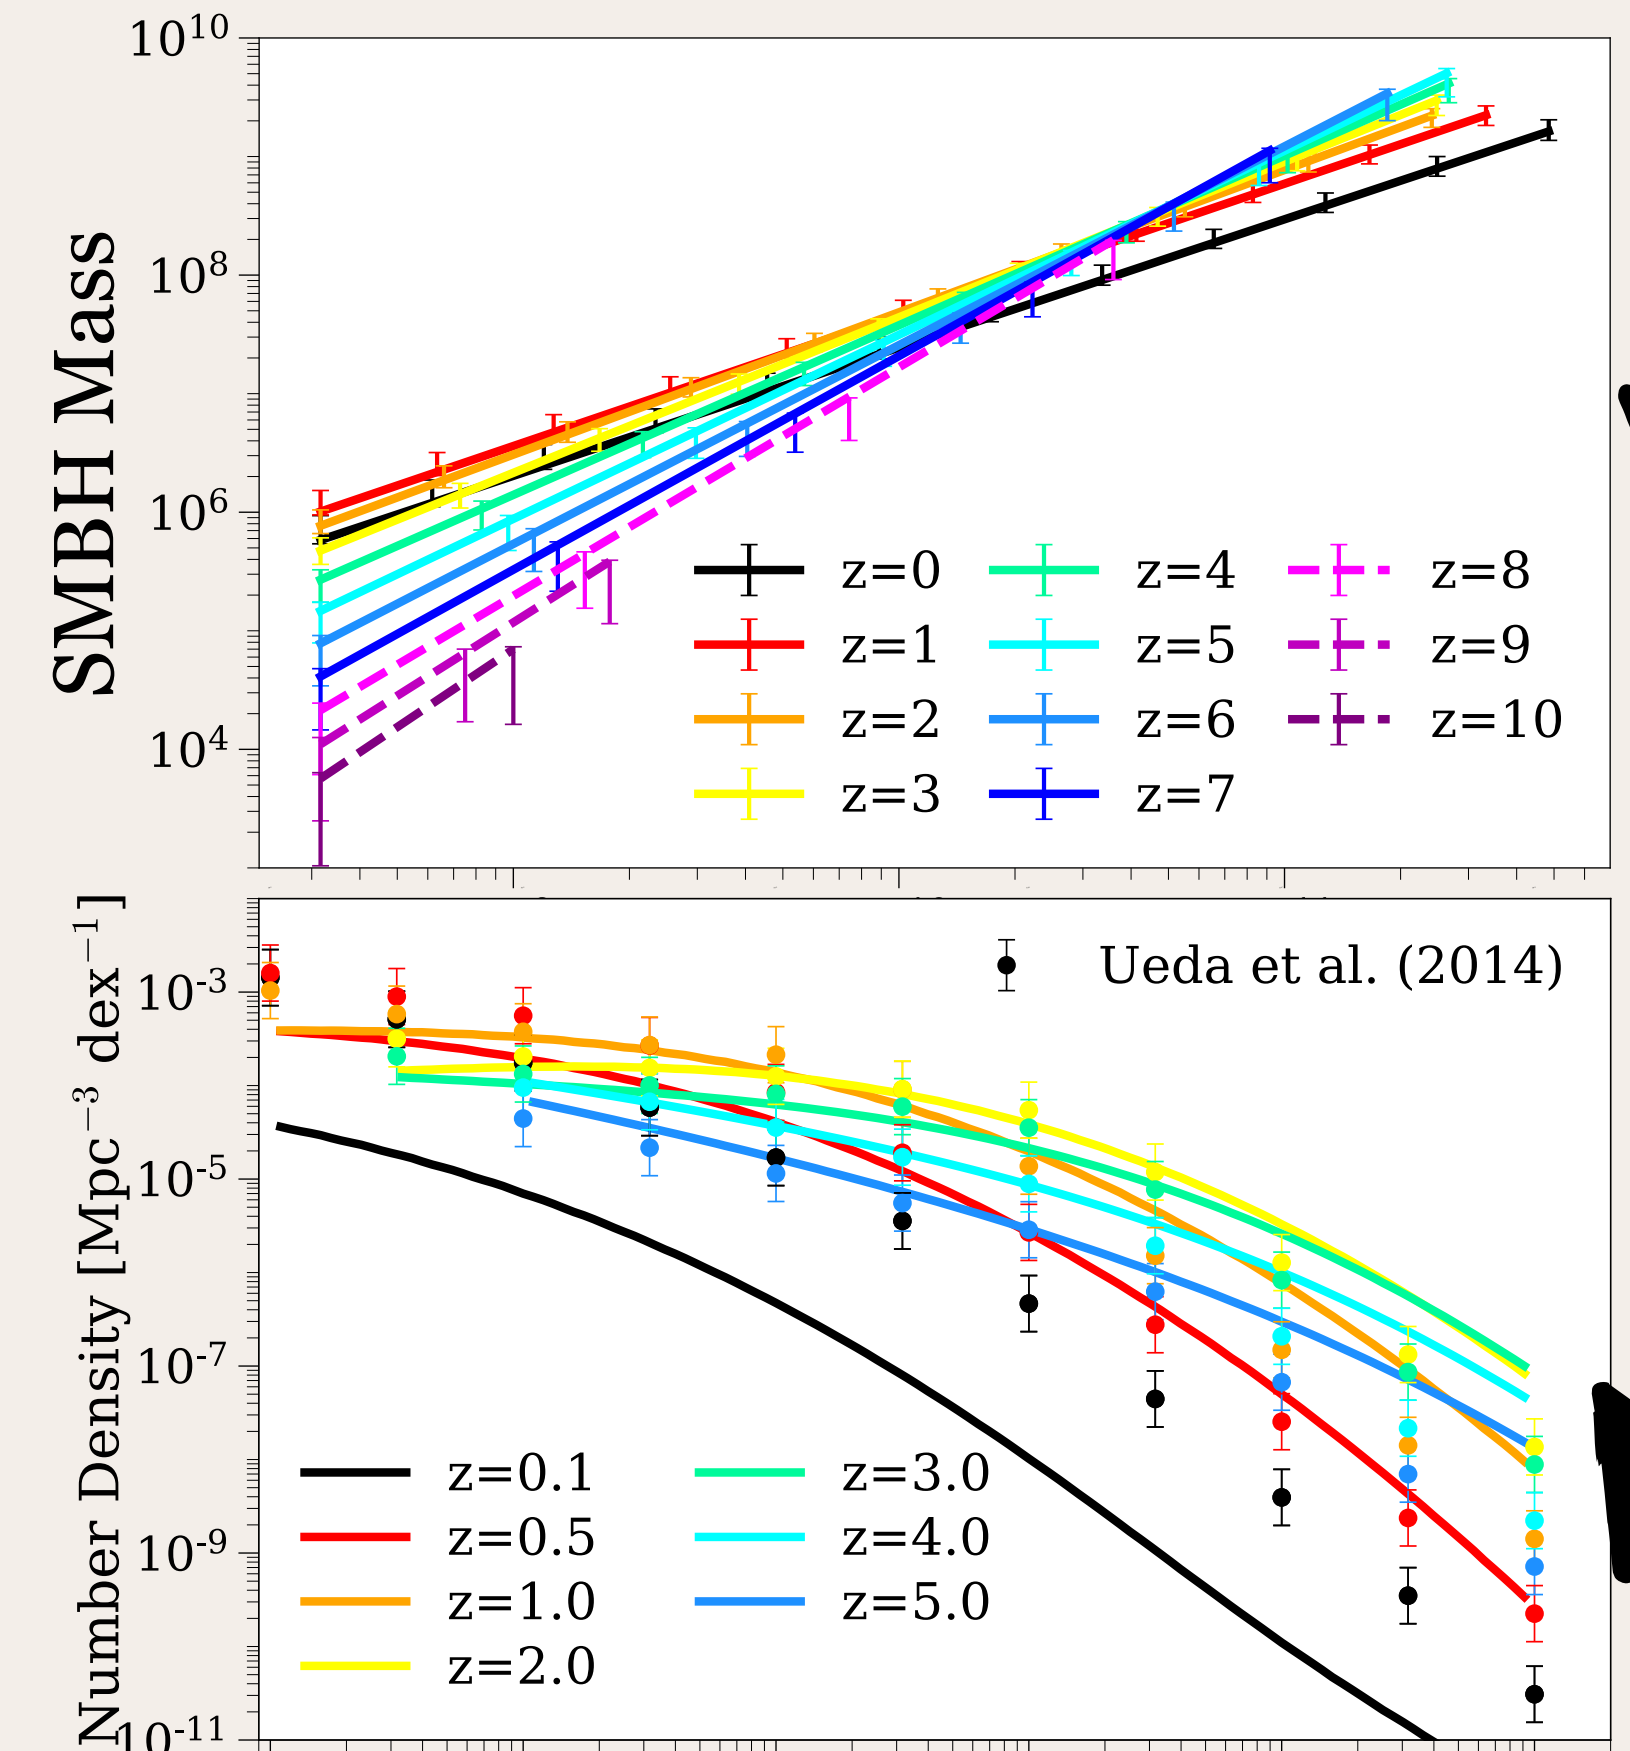

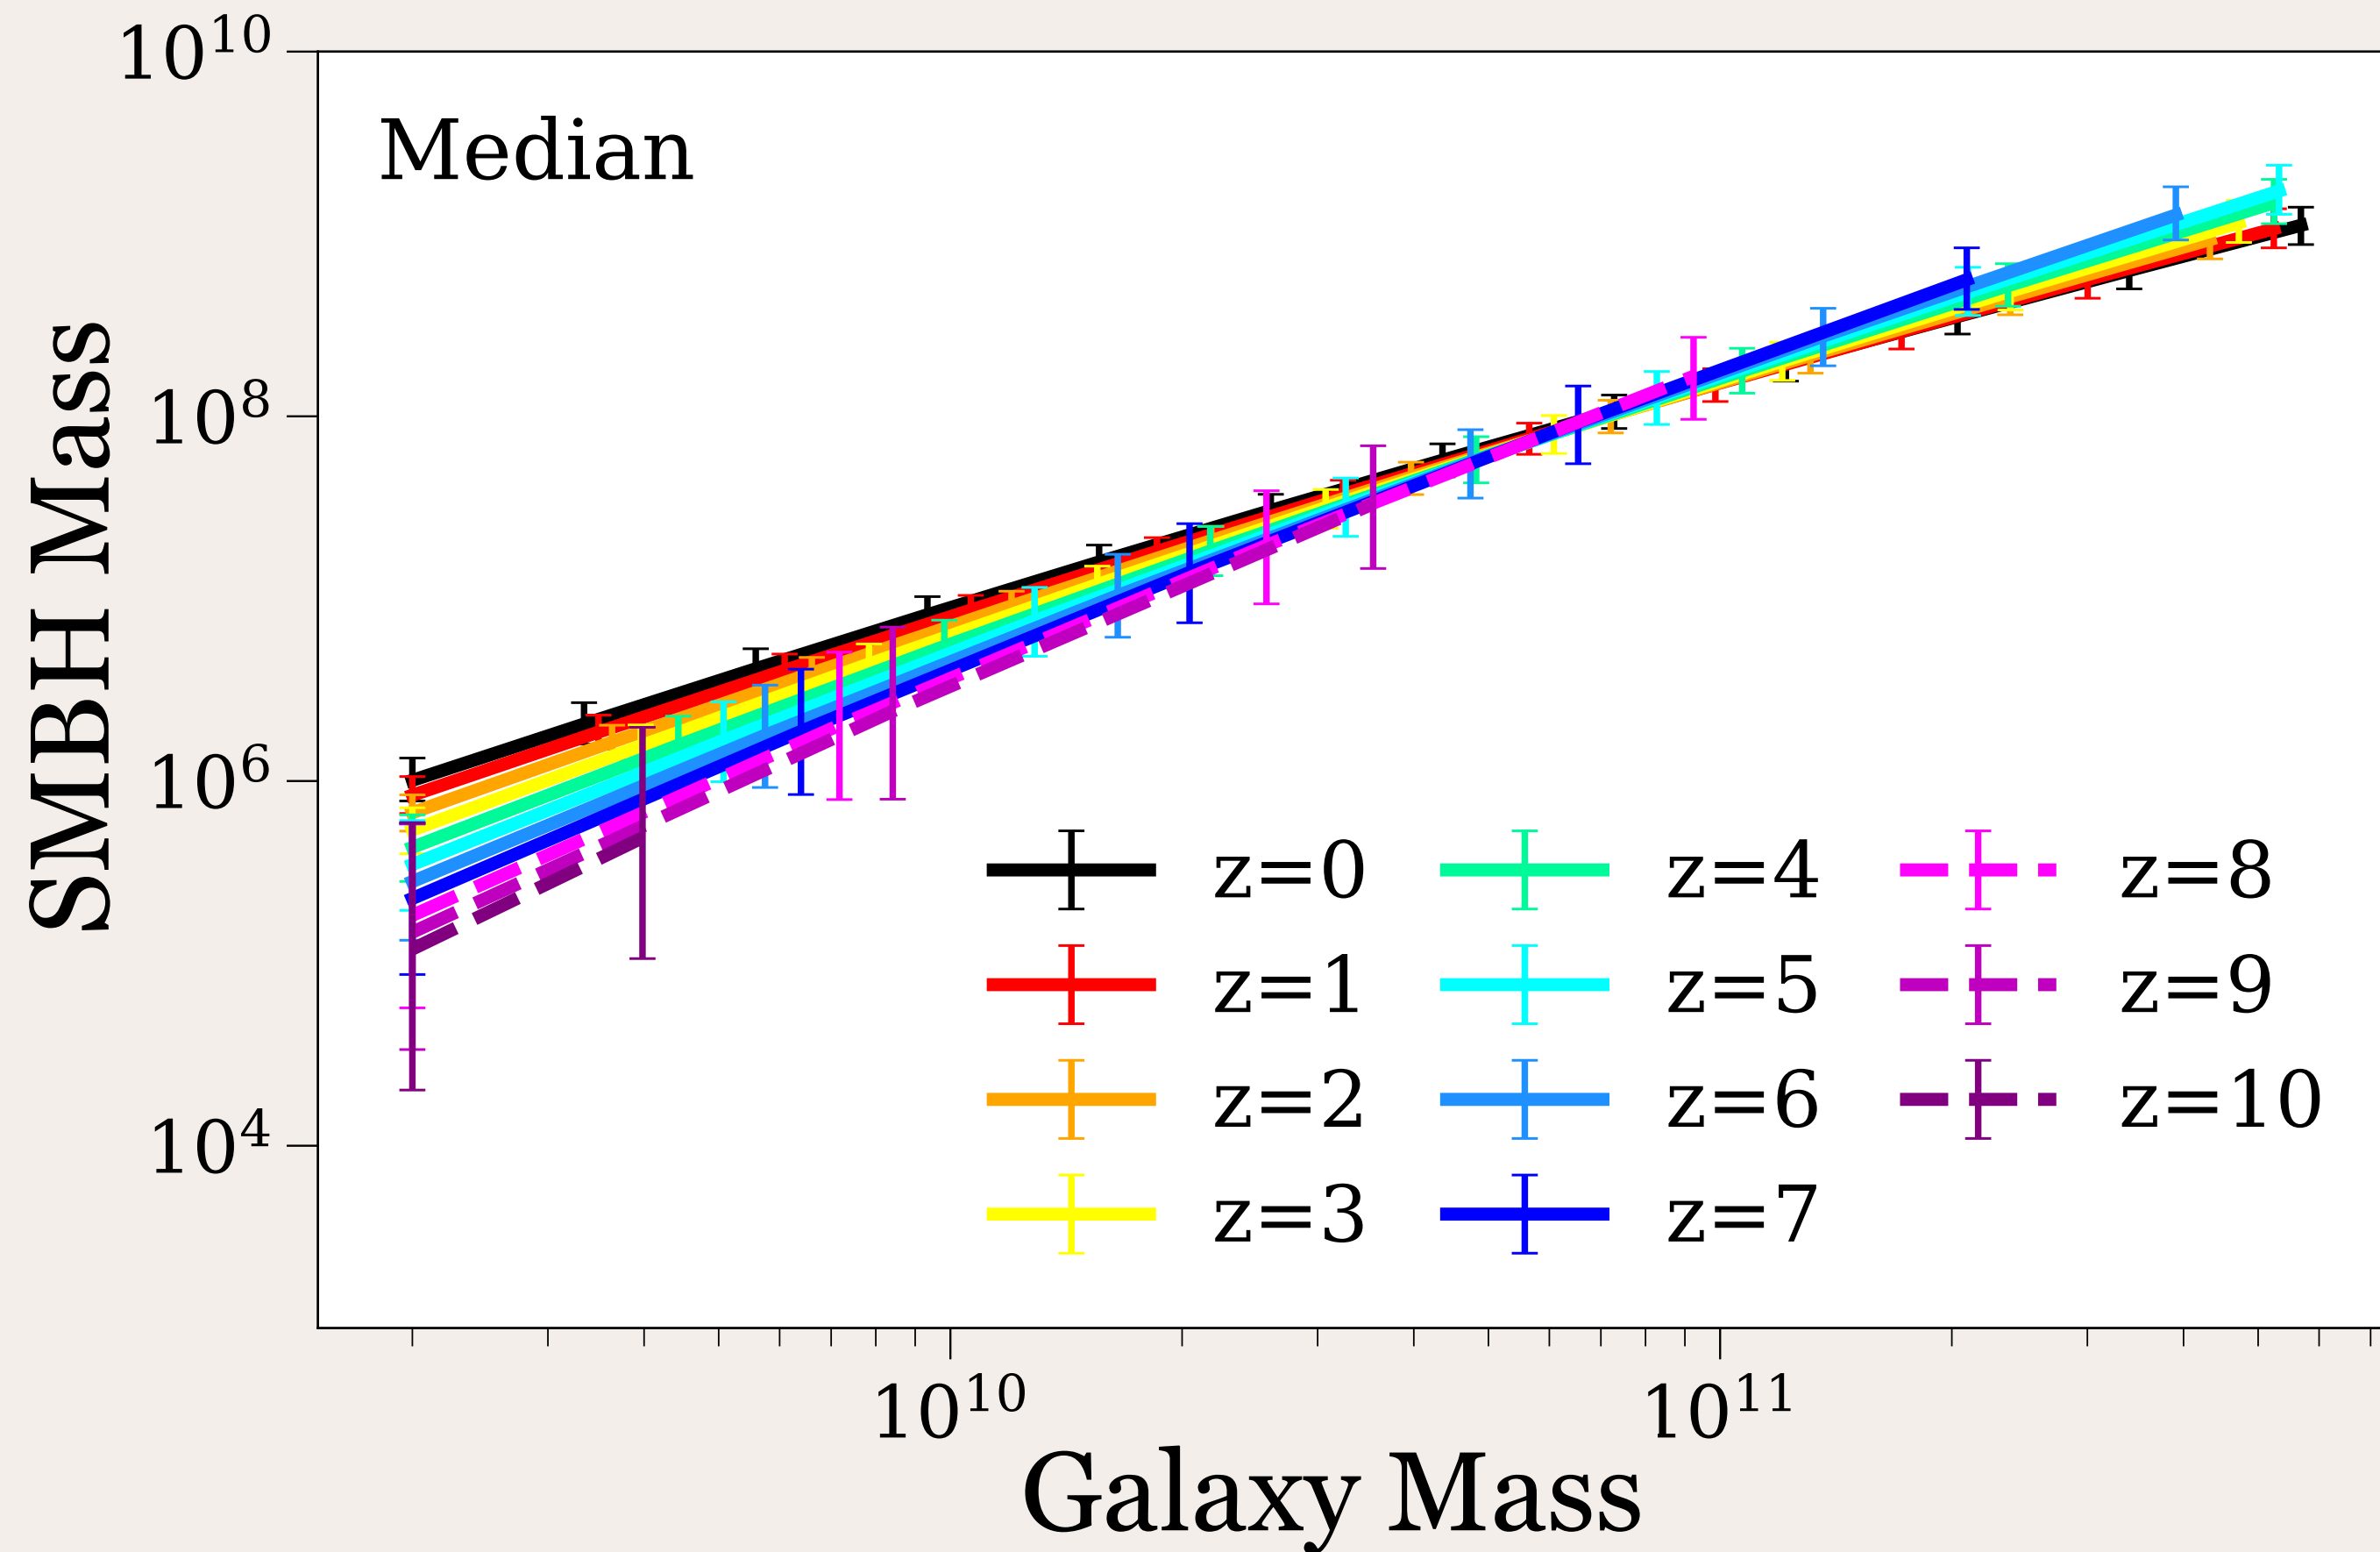

Type I Quasar Black Hole Mass Functions

$z=0$ BH mass—bulge Mass Relation

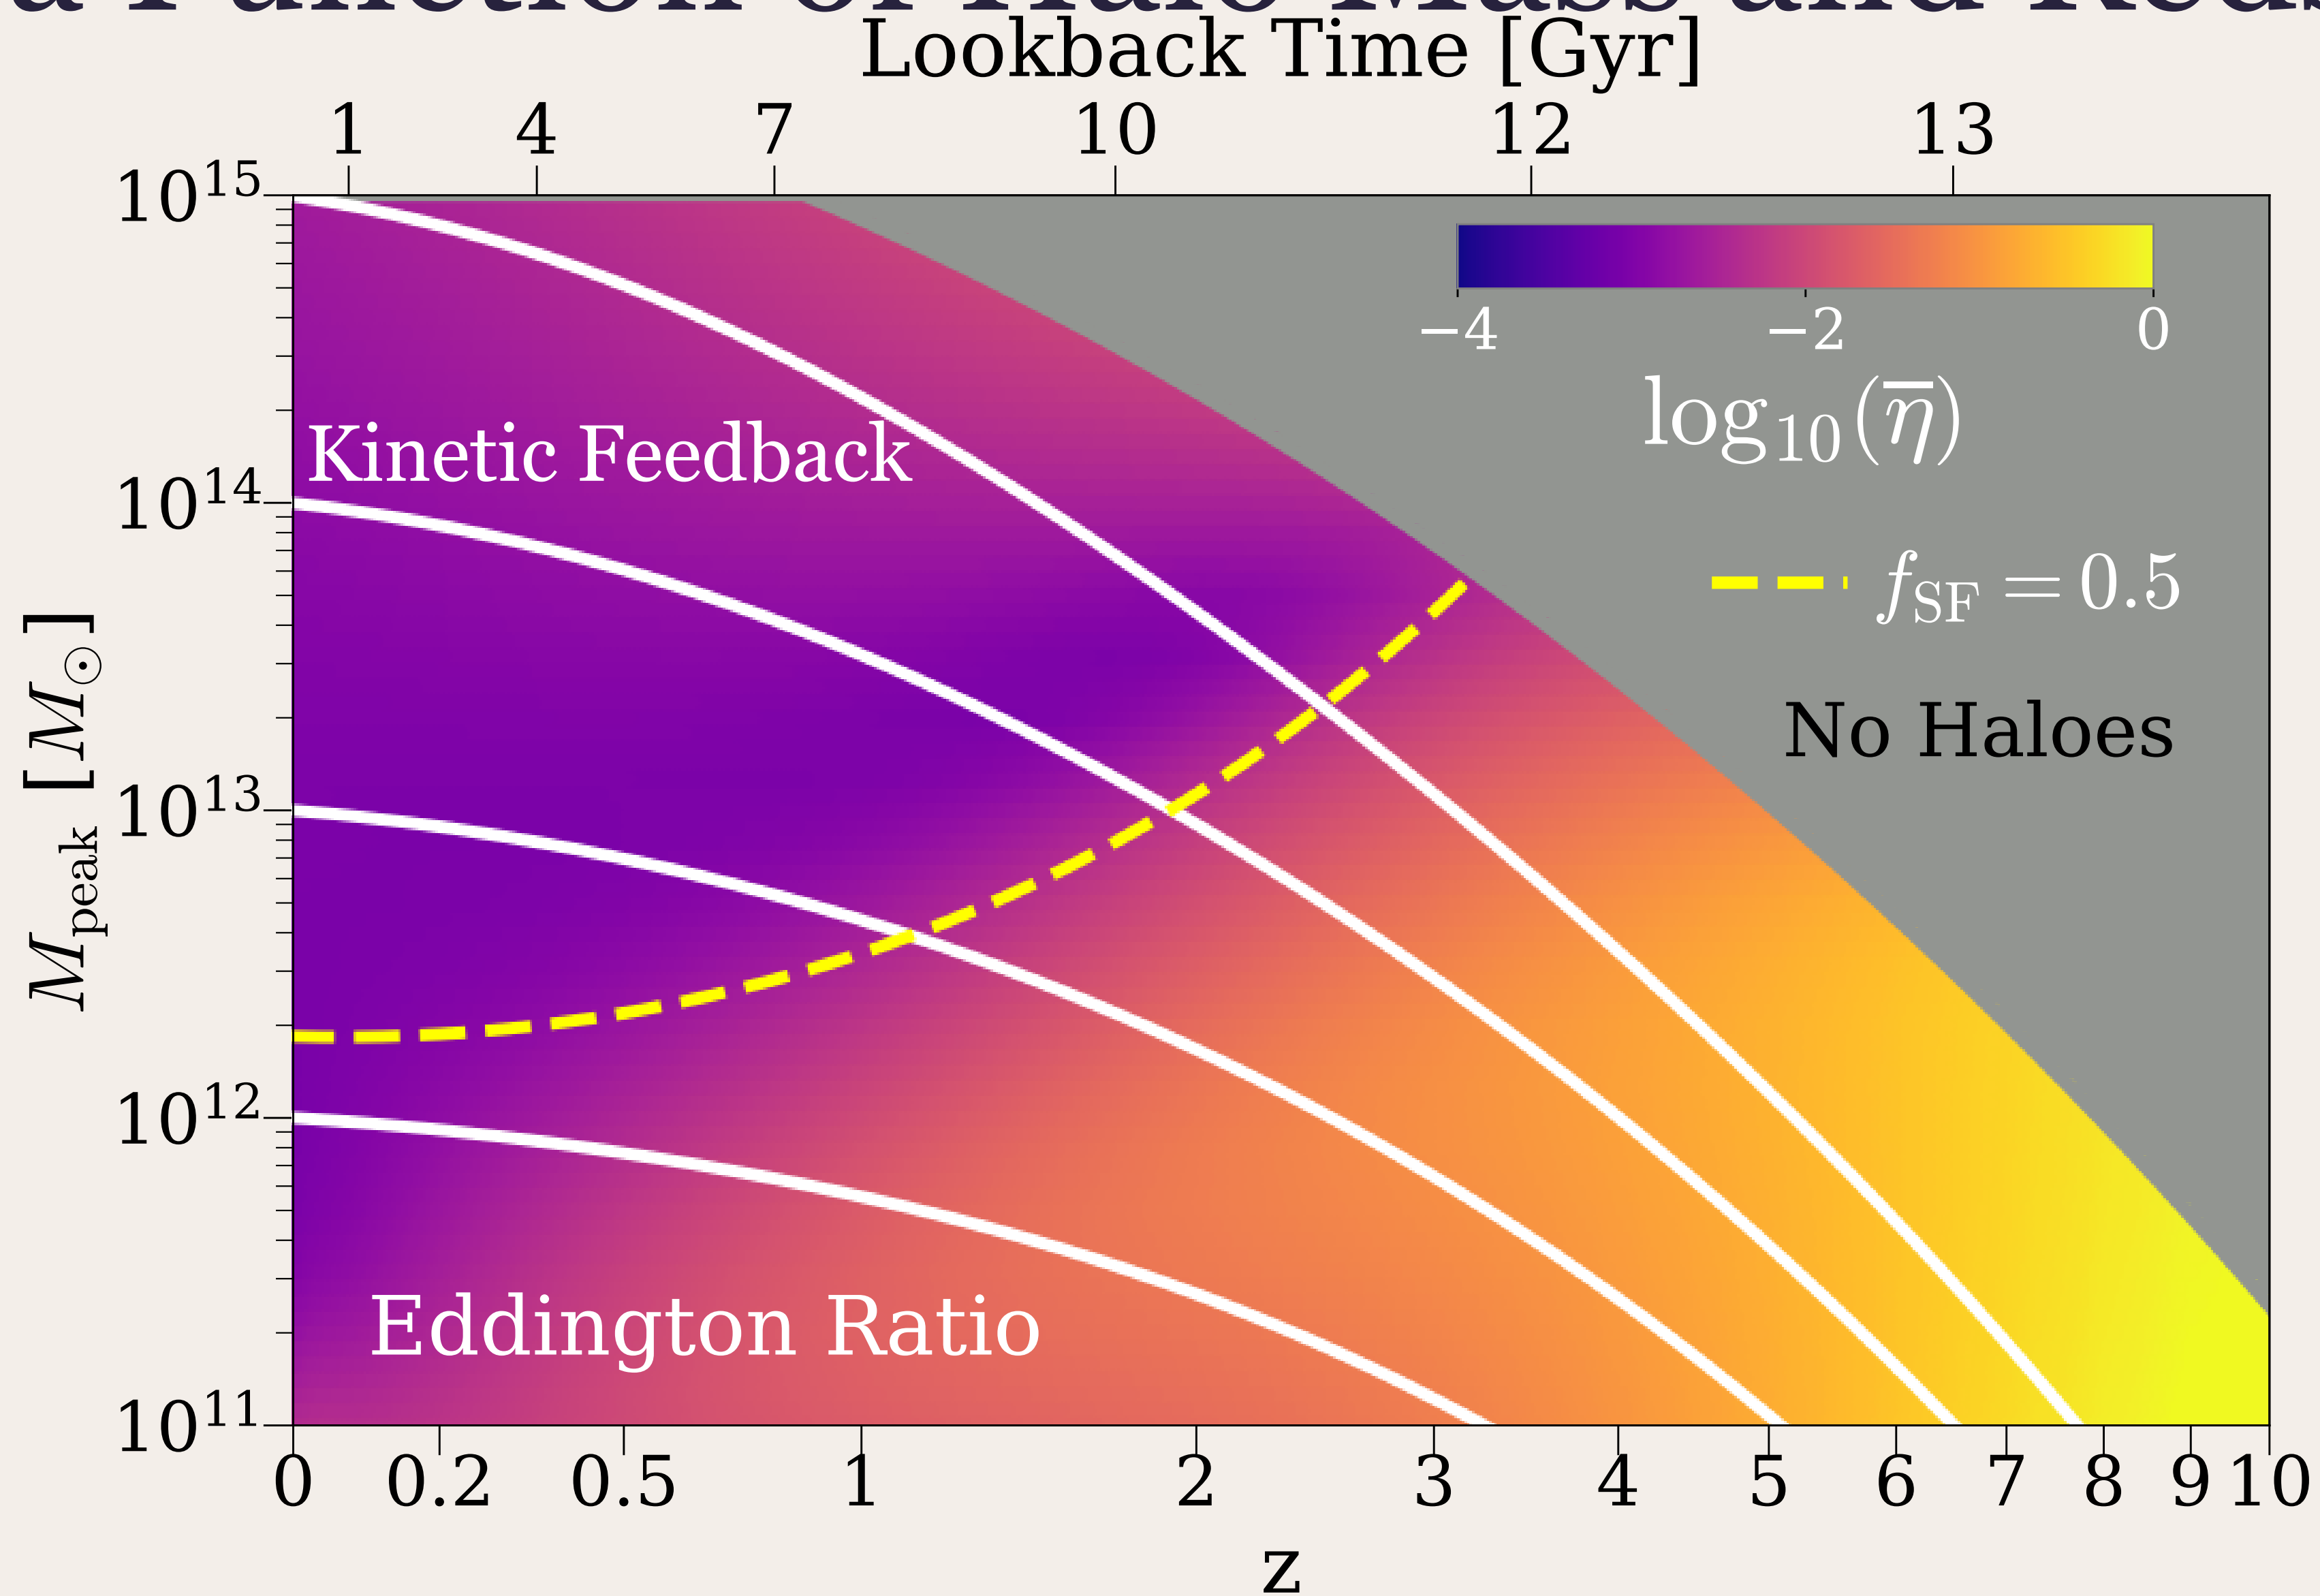

TRINITY Prediction: SMBH Mass—Galaxy Mass Relation

WRONG galaxy—SMBH relations *violate* data constraints, e.g., quasar luminosity functions

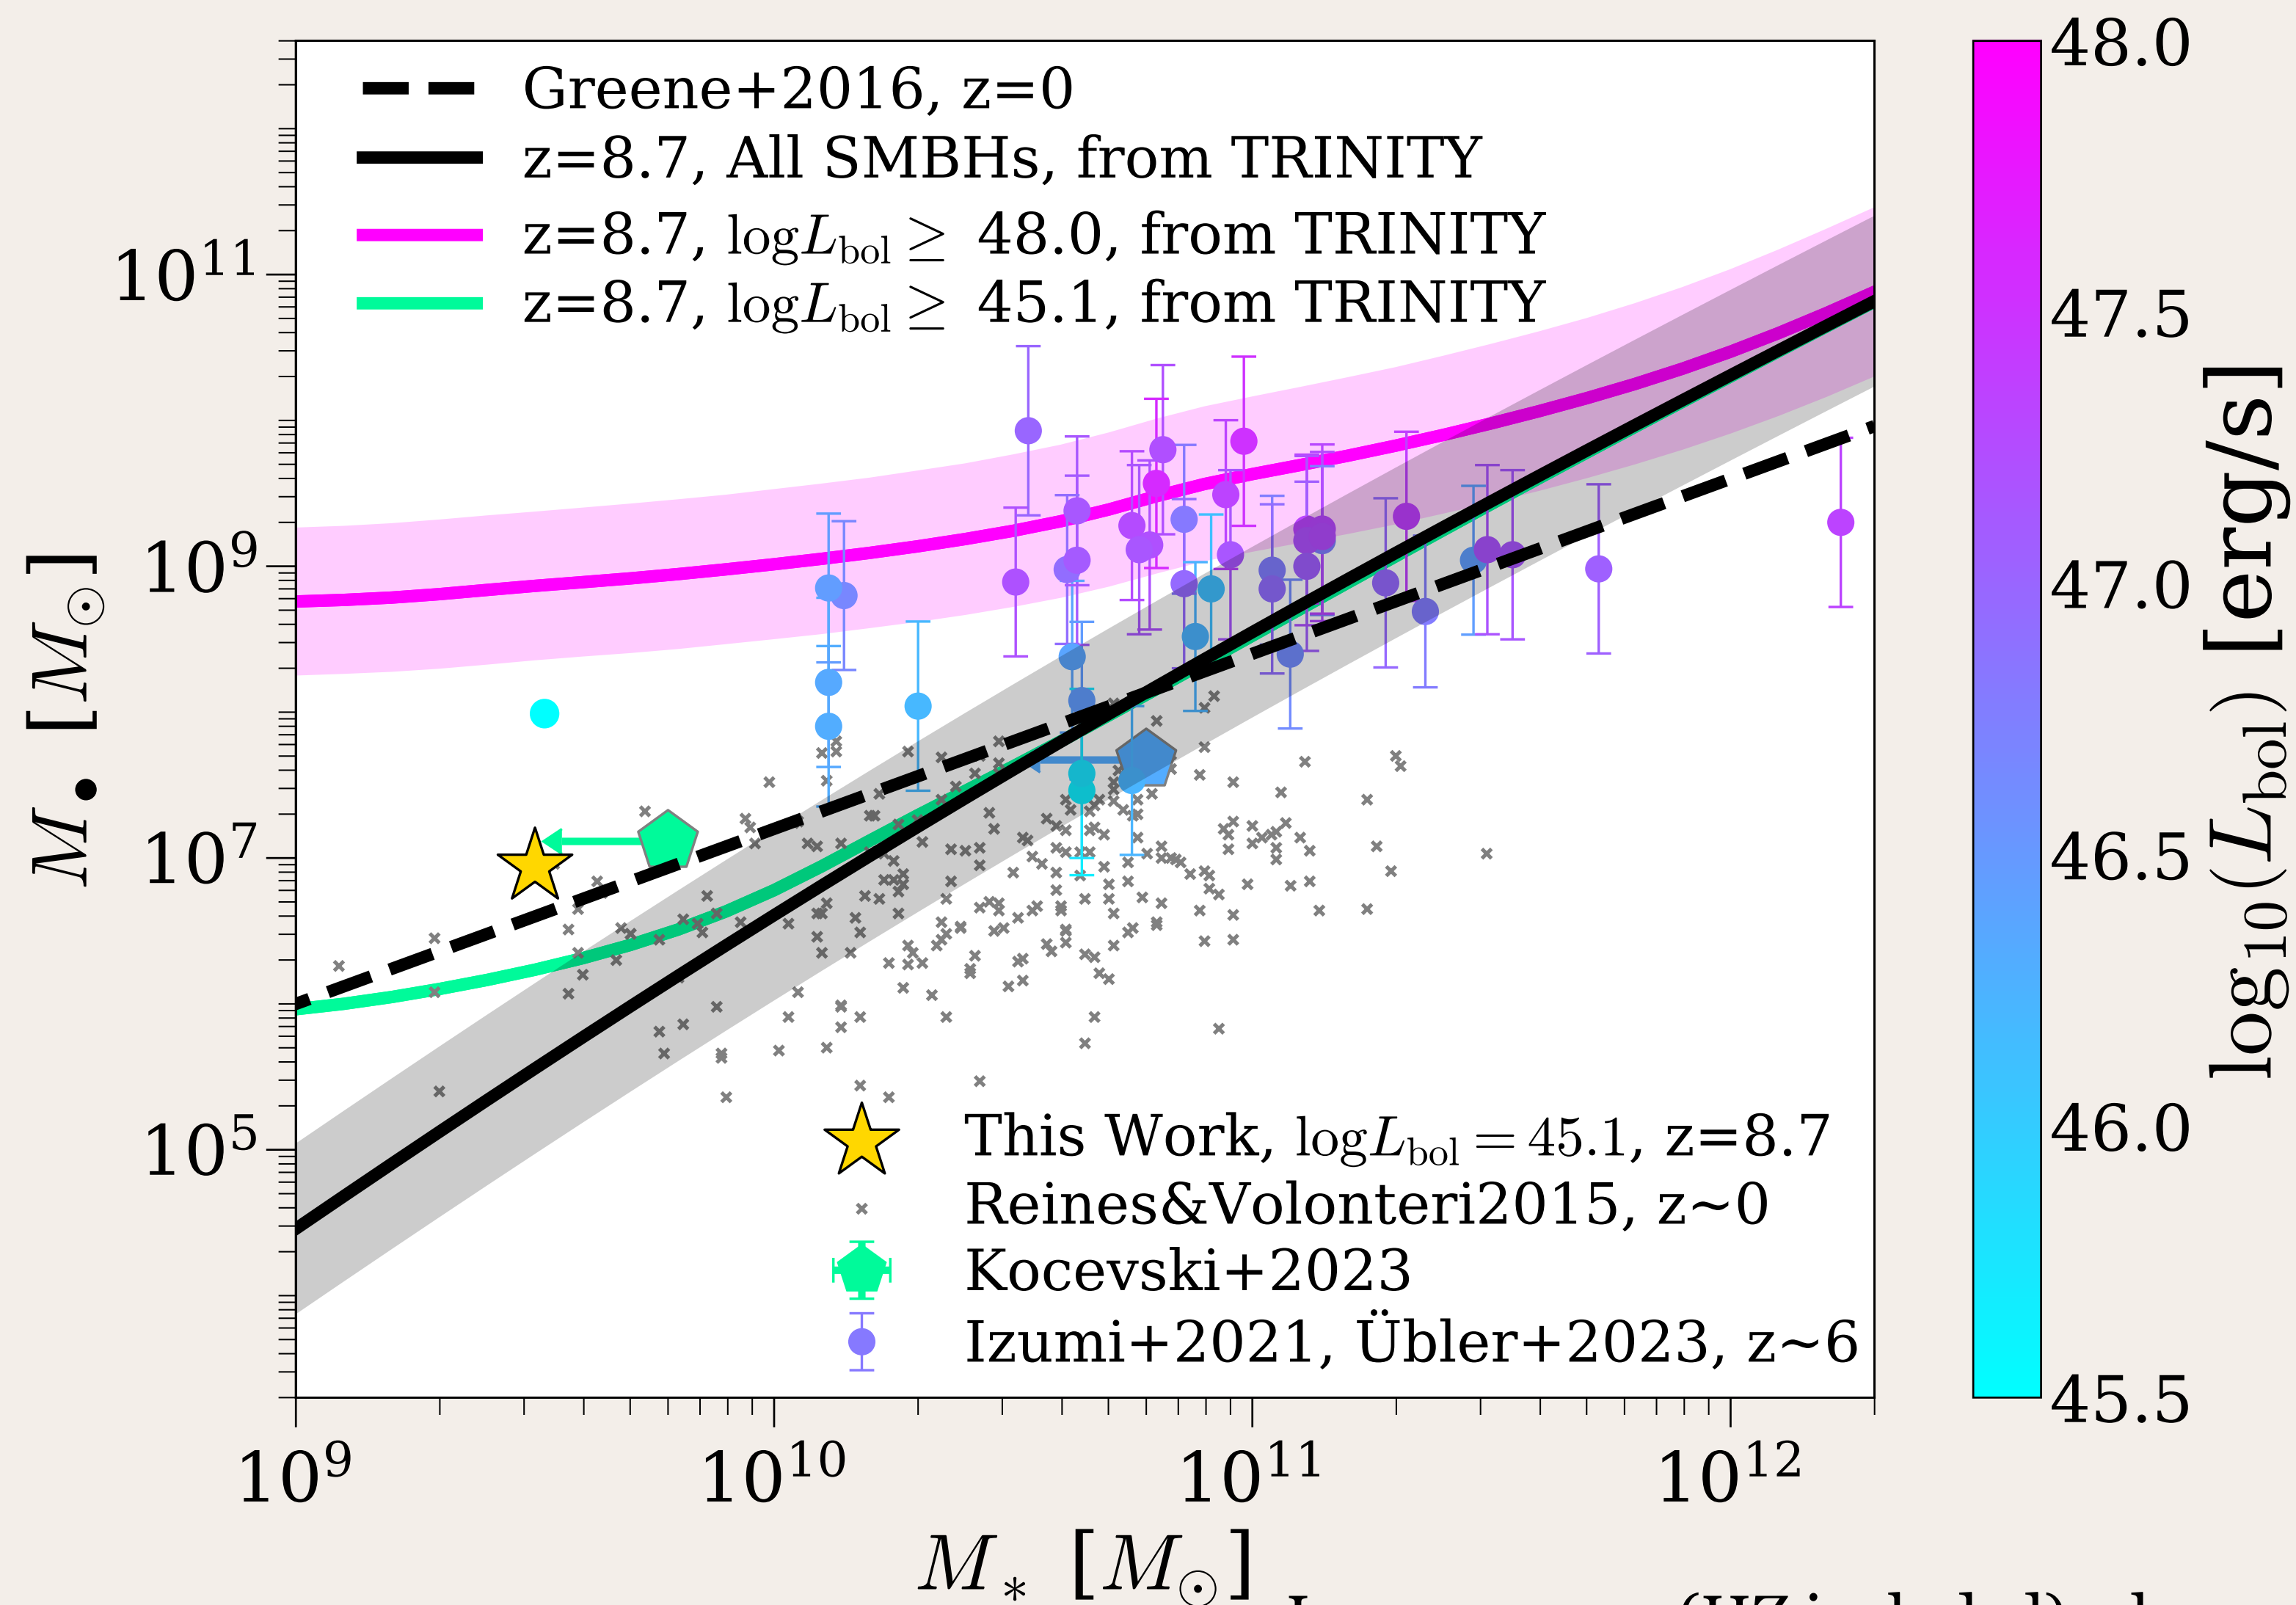

TRINITY Prediction: Average Eddington Ratio as a Function of Halo Mass and Redshift

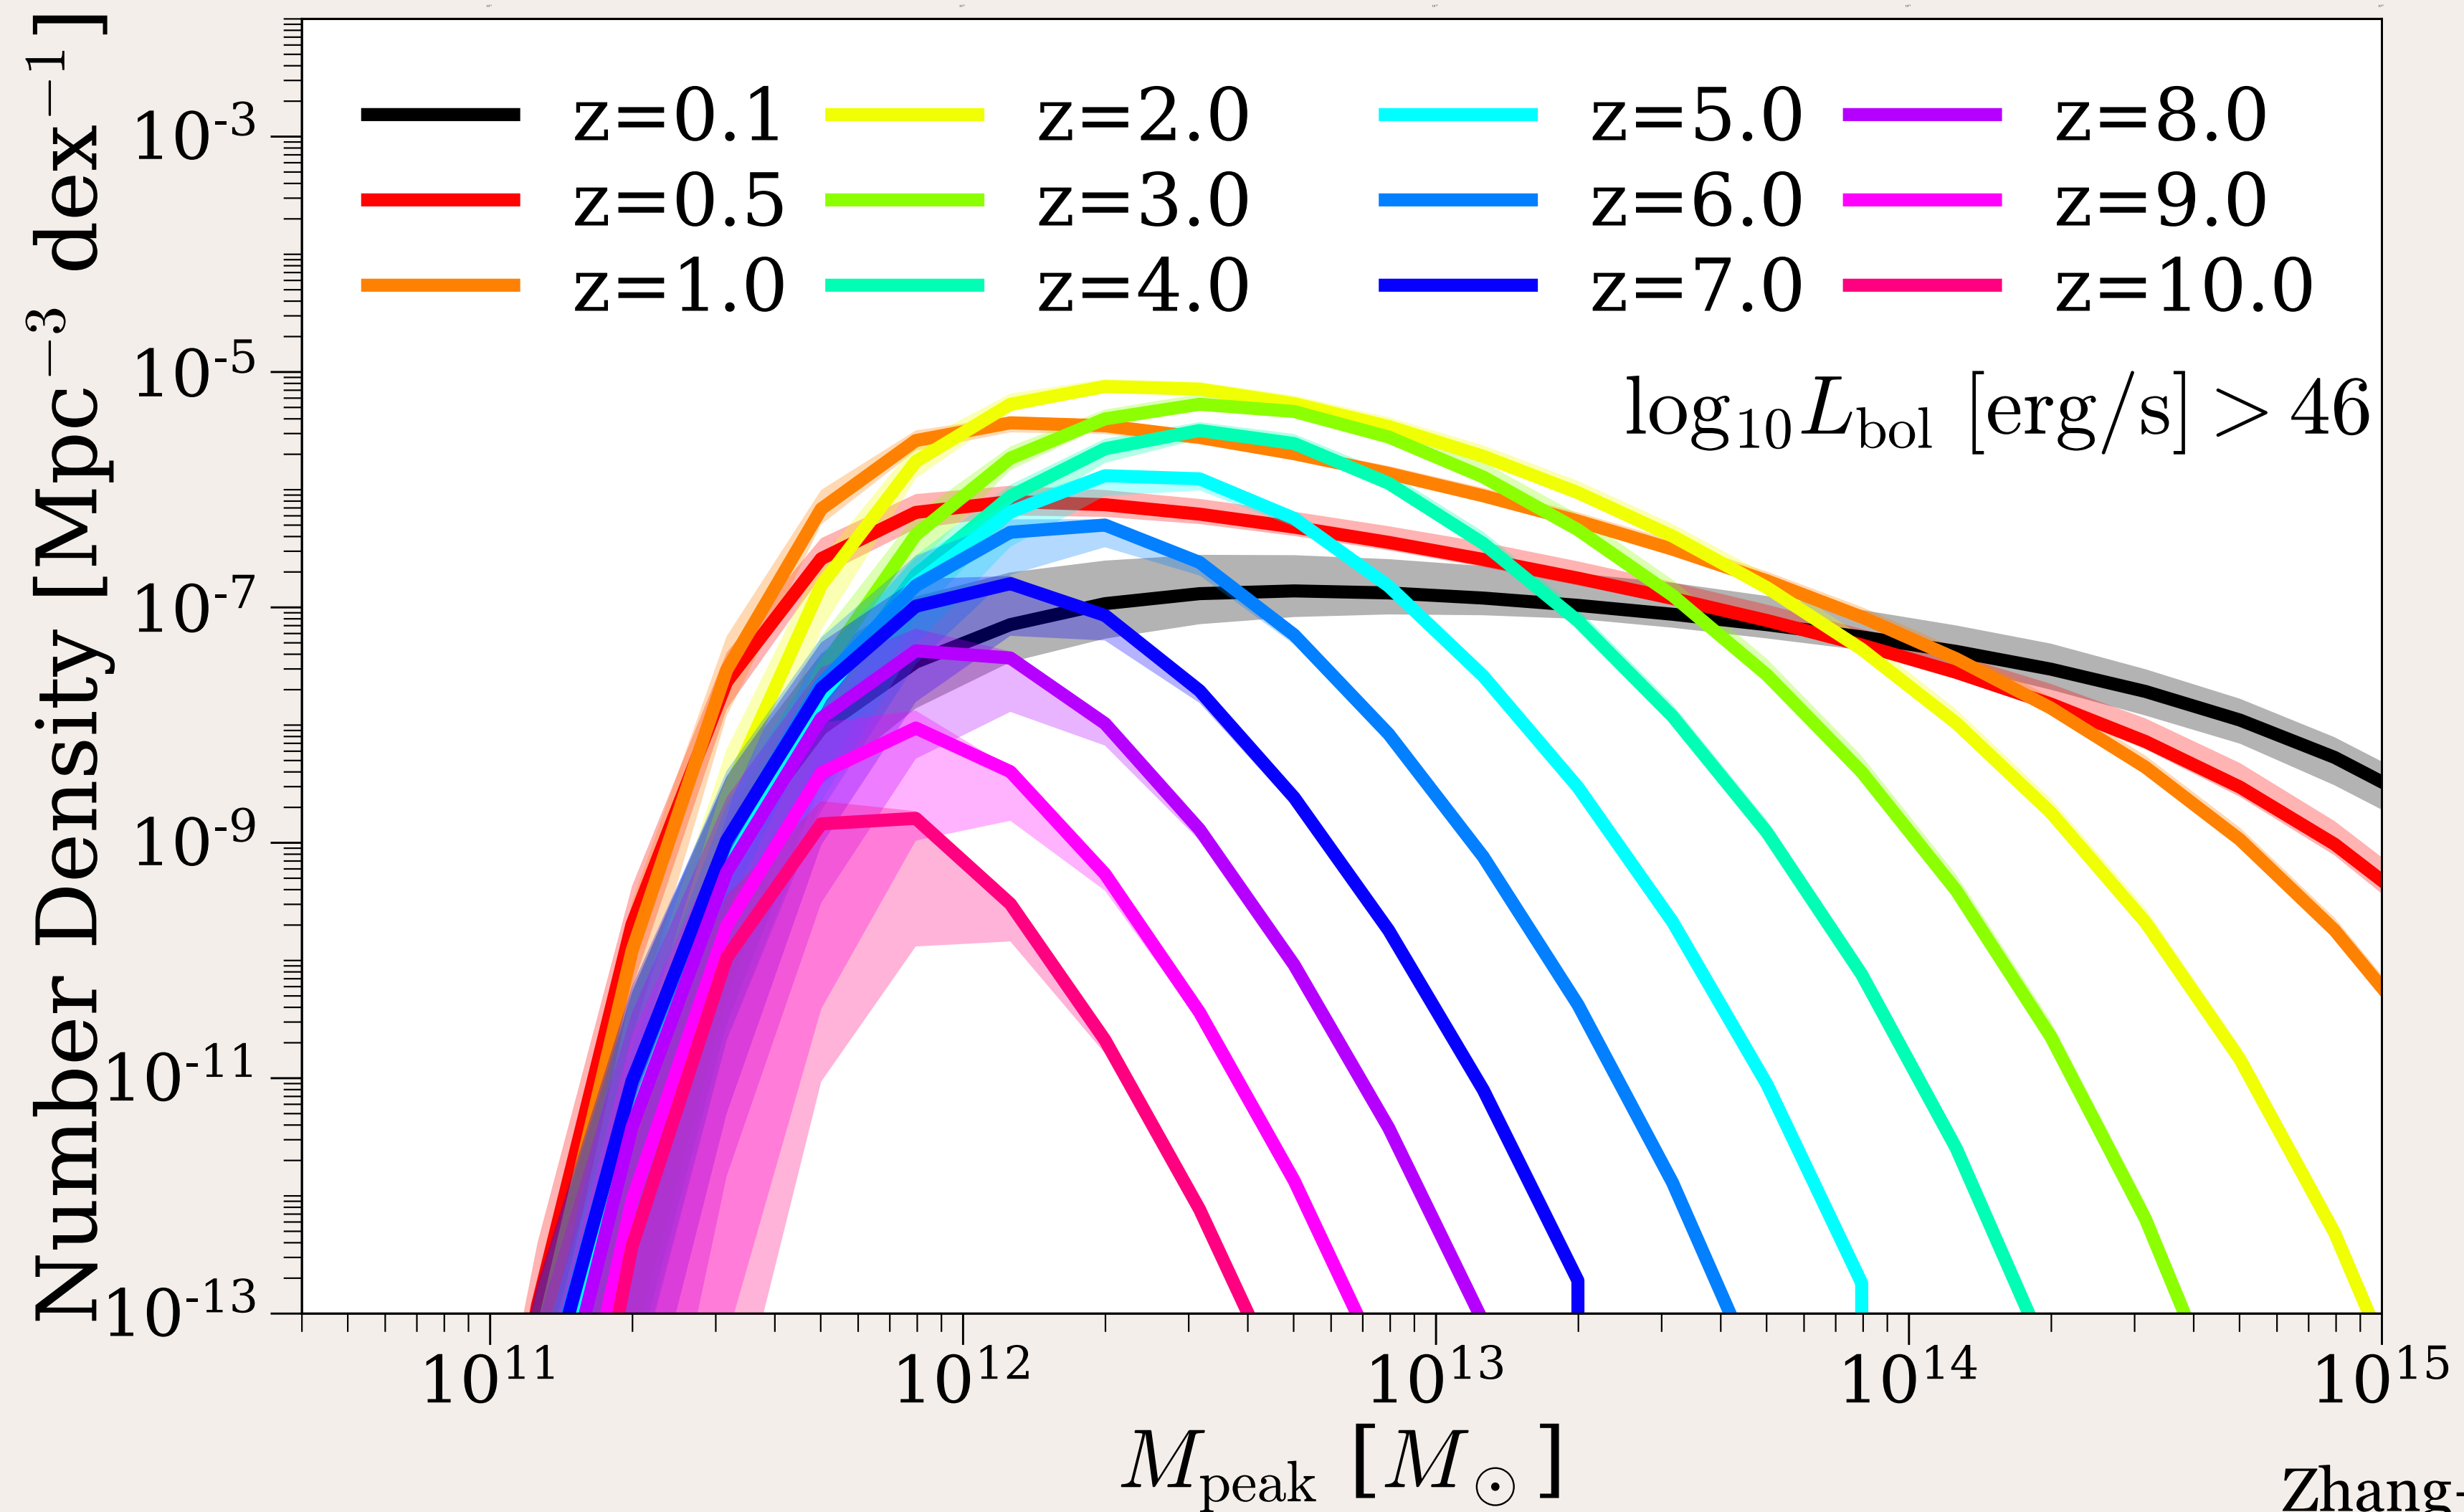

TRINITY: Luminosity-dependent Bias in the $M_{\bullet} - M_{*}$ relation for quasars

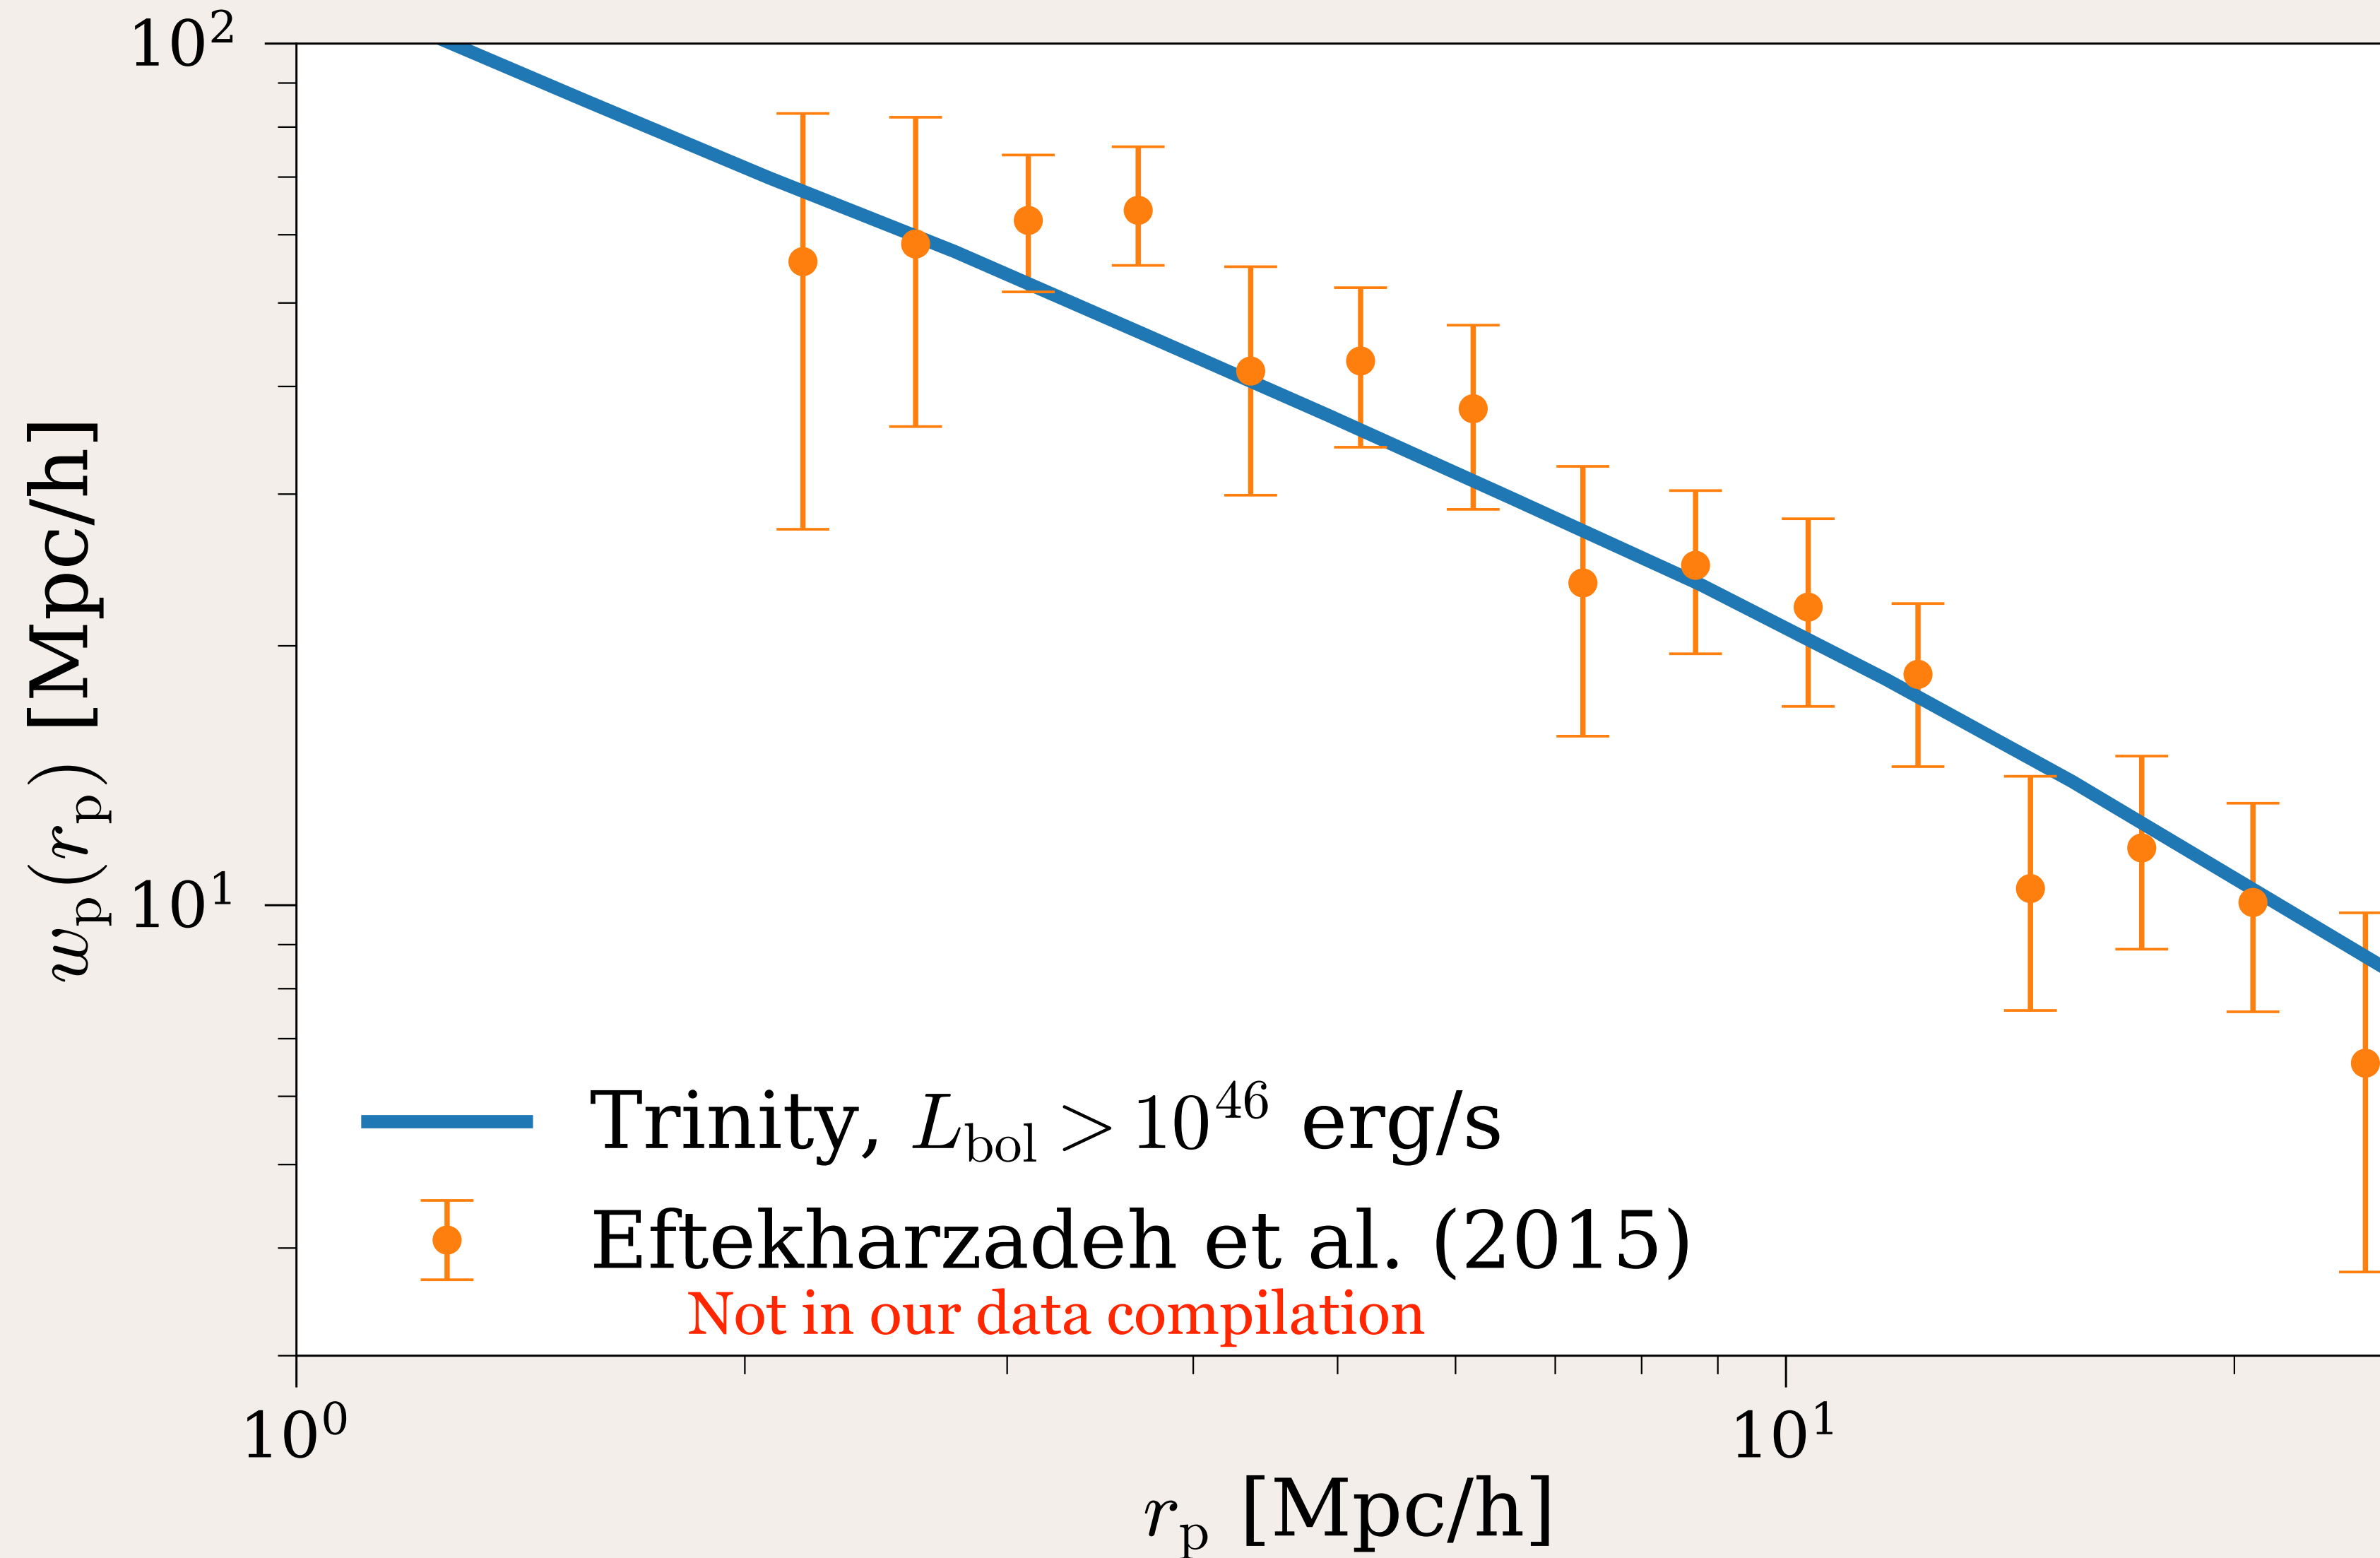

TRINITY: Luminosity-dependent Bias in the $M_{\bullet} - M_{*}$ relation for quasars

TRINITY: Quasar Host Halo Mass Functions from $0 < z < 10$

TRINITY Prediction: AGN Clustering

Oddisey Knox
(Undergraduate@UofA)

Summary

- TRINITY: Flexible, data-driven empirical model connecting halos, galaxies, and SMBHs for $z=0-10$
- Main Results:
 - SMBH mass—galaxy mass relation from $z=0-10$: Not much evolution;
 - High- z quasars are biased samples to study the high- z SMBH mass—galaxy mass relation;
 - Quasar host halo mass functions from $z=0-10$: peak around $10^{12} M_{\text{sun}}$;
- Future Plans: Trinity's predictions on gravitational waves, high- z quasar environments, and tidal disruption events around AGNs
